The information given on this page has been specially compiled for THE BUILDER and is copyright. Our aim in this list is to give, as far as possible, the average price of materials, not necessarily the highest or lowest. Quality and quantity obviously affect prices—a fact which should be remembered by those who make use of this information.

CURRENT PRICES FOR BUILDING WORK IN LONDON

EXCAVATOR.		s.	d.

AUGUST 21, 1925

VOLUNTARY HOSPITAL ACCOMMODATION

THE needs of the people of a great country with an ever-increasing population exposed to the uncertainties of life and health, due in no small degree to a complex state of society and the vagaries of a no less uncertain climate, have suggested many of the voluntary and efficient organisations which, with or without state assistance, have been established in our towns and cities. Of these organisations, the voluntary hospitals of the country take a leading position and surely no more beneficial agencies could be established, not only to help our individual needs, but to safeguard the health and well-being of the country as a whole. The provision of adequate hospital accommodation has been one of the first obligations of those responsible for the administration of the medical charities of the country, and the results so far achieved by the personal service of a large body of disinterested workers are some testimony of the zeal with which the work has been carried out. But what has been accomplished falls far short of the requirements, and though the voluntary system, which a few years ago seemed doomed, has since taken a fresh lease of life, there can be no doubt that a service of such vast national importance should receive an adequate measure of State support.

The building undertaken since the war has not been of much extent, and the hospitals have not expanded with the growth of the population. But there has been a distinct improvement in the last two years, though a large proportion of the building undertaken in this period has been in respect of additional accommodation for nurses. The distribution of the Government grant of £500,000 and the effort voluntarily made has resulted in a marked improvement in the financial position of voluntary hospitals, so far at least as current maintenance expenditure is involved. Attention has since been directed particularly to the need for the provision of additional hospital accommodation, and early in 1924 the Minister of Health (Wheatley) asked the Voluntary Hospital Commission to inquire, on the following terms of reference:—

The Voluntary Hospitals Commission are requested to inquire into and report upon the extent of the additional voluntary hospital accommodation required in England and Wales and the best means of providing and maintaining it."

The Commission has now presented their report to the Minister of Health and this has now been published by the Stationery Office as a Command Paper (Cmd. 2486). At the commencement of their report the Commission point out that there is no general agreement as to the number of hospital beds required for a given population; and they have not attempted to lay down any ideal standard, as they felt that in the present circumstances inquiry could be more usefully directed to a consideration of what extensions could be regarded as immediately necessary and capable of accomplishment within a reasonable period of time.

In approaching the problem of the additional accommodation required and the means of providing and maintaining it, the report refers to a number of incidental questions such as:—(1) Waiting lists, which provide a criterion of doubtful value in estimating the need for additional accommodation;

(2) The importance and relative merits of convalescent and nursing homes as a means of relieving the pressure on the beds of primary hospitals;

(3) The possibility of economy by means of co-ordination.

In the last mentioned matter the Commission report that there is at present a multiplicity of institutions whose functions overlap, and they express the opinion that if the Managing Committees could arrive at a mutual arrangement for co-ordination of work, economies might result both in expenditure and in accommodation.

The additional accommodation recommended by Local Voluntary Hospital Committees outside London amounts in England and Wales to 10,614 beds, and King Edward's Hospital recommends an addition in London of 2,088 beds. Details of the recommendations of the various areas are given in an

appendix of the Report. The Commission regard the London figure as a conservative estimate and they express the conviction that it does not permit of any reduction. But they come to the conclusion that the recommendations of some of the Local Committees are in excess of the immediate needs, and therefore consider that there should be a reduction of 20 per cent. on the provincial figure.

The reports of the Local Voluntary Hospital Committees and the experience of the Commission in distributing the Parliamentary grant of £500,000 towards maintenance deficits point to the conclusion that the voluntary system has now recovered sufficiently to be able to undertake the maintenance of the 10,000 additional beds proposed. Figures are quoted in an appendix showing that in 1923 the voluntary hospitals in England and Wales (including London) taken as a whole, had a surplus on the maintenance account amounting to almost £497,000. But though during the last few years the majority of the hospitals have been able to balance their budgets, there has been no margin out of which capital for expansion on any considerable scale could be provided. In the circumstances the Commission recommend that some measure of State assistance is essential. Failing such assistance there is in most cases no prospect of essential extensions being undertaken within the next few years; and the Commission remark that "failure to meet the present needs of a growing population will not only entail a great amount of avoidable suffering, but it must also react to the prejudice of the voluntary system."

On the question of the incidence of building, the Commission think that the presumption should in general be in favour of suburban rather than urban extensions, unless it can be shown that there are special circumstances, such as the possibility of adding an additional story at relatively low cost, which would justify an exception to the general rule. They think also, that the erection of costly buildings of elaborate design should in general be discouraged, and that preference should be given, where sufficient space is available, to buildings of a more utilitarian and less permanent type. The development of medicine is bringing with it constant demands for variation in design. There is no finality in hospital design, and the more permanent type of building adopted the more certainly will it become obsolete and require costly reconstruction in a generation or two.

With regard to the amount of the proposed State grant, the Commission have given considerable attention to the question of what may be regarded as a reasonable cost per bed, and some of the most recent buildings have been specially inspected. It is clear that the cost in any particular case must be dependent on local circumstances. But they are advised that at present-day prices, excluding the cost of site, furniture and equipment, a reasonable figure for the cost of extending plain buildings of a utilitarian character would be £400 per bed. Where it is necessary that the additions should conform to the architecture of the rest of the building this figure might be considerably exceeded, but they think it represents the minimum allowance for the bare cost of providing additional bed space. Schemes of extension which are now in hand show in some instances a much higher figure, but in most of these cases the schemes include other improvements, besides the provision of additional bed accommodation. They recommend that the State should provide 50 per cent. of the cost up to a maximum of £200 per bed on condition that the remainder of the expenditure is raised locally or is available from existing building funds. The Commission recommend that the first condition of administering such a grant as they contemplate should be to require each Local Voluntary Hospital Committee to submit a scheme for the provision of the necessary new beds in its area, if necessary in consultation with the Local Committees of any other areas interested.

With the main conclusions of the Commission we agree, but we think more might be done to make hospitals self-supporting. Many patients who now go to nursing homes could surely be offered facilities and concessions which would induce them to make more use of the hospitals of the country.

NOTES.

Questionable The opposition which has been raised to the scheme for new working-class dwellings in Limehouse is a curious commentary on our modern efforts to ameliorate the conditions under which the poorer classes live. This opposition has brought into sharp relief the contrast between the ordinary cottage type of dwelling and blocks of flats, and it pertinently suggests the need for much discrimination and patient regard for the feelings of others, even when our main object is to benefit them.

The Limehouse Battle. It might have been imagined that the substitution of blocks of model dwellings for a few acres of rather ramshackle property in Limehouse would not have raised the excited controversy to which the columns of the daily press have called attention during the past week, but whether by accident or design the Stepney Council has lighted on an area evoking crucial grounds for differences in opinion. In the *Observer* of

August 16 we see it noted that this small patch is not "just a segment of the East End, like any other East End in Christendom, but virtually a self-contained village community, proud, independent, and with an industrial ancestry. A century and a half ago fish-curing started there; to-day there are half-a-dozen curing yards in the area supporting, directly and indirectly, probably not far short of a hundred families. The sheds are, literally, in the backyards of some of the houses. In the evening, when stoking up for the night is going on, you may stand at your back door under a gas attack of acrid deal and oak sawdust fumes, with the haddocks hanging before you all a-row. It may not be ozone, but at least it is livelihood, and a livelihood right at your door, as it was at your father's and grandfather's before you. People grow as jealous of work like that as the old hand-loom weavers of one hundred years ago did of theirs." Apart from this particular industry which supports at least two hundred people, many living in the threatened quarter have little gardens where they grow flowers, and keep chickens and rabbits, while here

and there you find a pigeon-fancier. How would these recreations fare in proposed "models"? Would they all be forbidden?

Reorganisa- TAKING the case of the dominant industry—haddock curing—then carried on in competition with large concerns at Aberdeen, Grimsby and elsewhere, and though it succeeds in holding its own for the moment, if once disturbed the costs of re-establishment would probably overweight it, and thus those it supports would be unemployed. It is conducted in a cleanly manner and does not appear in the least detrimental to health. Other activities might be better accommodated further afield, but that is altogether the question, which is less of reconstructing buildings than of bringing up a well-conducted community possessing a clearly defined ideal of living. It must be admitted that many of the cottages, though by no means all, have long passed their best days, that they are small and cramped and in urgent need of repair, also that in several places they are packed far too closely together. With these admissions it yet remains questionable whether the proposed course of substituting quite another type of dwelling is justified, as it is practicable to reorganise up to a reasonable standard with very little disturbance. In the centre of the area the Stepney Council has a district "casual" block, the possession of which was not improbably instigated their scheme. This site could easily be developed to rehouse those to be evicted from the cottages that it would be desirable to clear away, and for stabling, the distribution of which is at present open to criticism. The majority of the cottages, if removed and in some cases enlarged, would make decent dwellings, and the bulk of the present population would remain accommodated in the fashion they desire, which is appropriate to their needs, and in no way a danger from the point of view of health. With the menace of eviction hanging over them, the land would doubtless be amenable, and in a case there should be little difficulty in adopting such measures as in re-organisation rather than destruction. Of course this would require closer and more intelligent attention than a simple clearance scheme, but this is to be an instance where, on social grounds, such a line of action is clearly indicated.

Thames Bridges. PROFESSOR BERES PITE writes to the supporting Sir Reginald Blomfield's "weighty

test against corrupting the æsthetic quality of Waterloo Bridge," and in doing remarks that "the cantilevered footings to London Bridge have already destroyed the once perfect simplicity of Reginald's greatest work," but he is not convinced that Sir Reginald's suggestion that the Charing Cross Bridge will solve the

Benenden War Memorial. MR. ALBERT TOFT, Sculptor.
From a Sketch by MR. T. RAFFLES DAVISON.

problem of Waterloo, as the Strand could not be burdened with increased traffic directed westwards from Waterloo. It admits that a bridge at Northumberland-avenue is wanted, but believes that the facts point to the provision of another bridge from the eastern horn of Aldwych," as has already been suggested. With this suggestion we are in agreement, but we believe a Charing Cross bridge must at some time or other be constructed. In support of the suggestion for a bridge from the eastern horn of Aldwych, Professor Pite says:—"Piranesi, among his 'Magnificences' of Rome, pictures a pair of bridges supporting and enclosing a classical façade upon the banks of the Tiber. The Thames is greater than the Tiber. Somerset House above the Embankment is better even than Piranesi's palace, and Waterloo Bridge is as fine in itself as, and finer in combination than, the Roman dream. London, already possessing the realisation of two parts of this vision, is pressed by the fortunate necessity to complete the third. May the London County Council be courageously inspired and not Byzantine in sightlessness; may it construct the twin bridges, and, like Waterloo, dedicate it to victory, earning the gratitude of all to whom the wonder of a noble river, treated architecturally, has a mysteriously glorious appeal!"

IT will thus be seen that Waterloo Bridge. two distinguished architects have repeated the warning we gave the other week as to the detrimental effect on Waterloo Bridge of overhanging footways. To suggest that this would give the sturdy Grecian columns on the cutwaters something to do is, of course, an absurdity. We are not surprised that Professor Pite sees a great possibility in the repetition of a Waterloo Bridge from the eastern arm of Aldwych, for two such bridges with Somerset House stretching across between them, would make one of the finest pictures in Christendom.

WE doubt not there are idealists like Professor Pite among the members of the London County Council, but it is not an age in which great ideals prosper. There is plenty of mawkish sentimentality about, but visions of true fitness and beauty have small chance. It should not be necessary to exaggerate the claim of Waterloo Bridge to our regard. But one might have thought that as such a quality in itself and such a position in the river perspective and its relation to Somerset House that it would set forth a lesson on the ideal possibilities of our great London Waterway which would be an incentive and a guide. The view of Westminster Bridge, with Pugin's wonderful towers and spires rising above it, would have been equalled

Bronze Group in Memorial Garden, Wootton Wawen, Warwickshire.

MESSRS. JOHN OSBORNE & SON, Architects. MR. RICHARD R. GOULDEN, Sculptor.

by the view towards Blackfriars Bridge as a foreground to St. Paul's if that bridge had been of good design. Our fine Victoria Embankment only needs a corresponding embankment on the southern side of the river to place our Thames waterway amongst the finest things in Europe. A heavy responsibility for the future of London rests now with those who have the final say as to how and where our new bridge designs will be carried out. Is there no body of public opinion which can be brought to bear on a subject so important to the future of London? We are being muddled with conflicting views and counsel about bridges and traffic for, amongst other things, we have been told that Professor Pite's advocacy of another Waterloo Bridge at the eastern arm of Aldwych means a final disappearance of a new road bridge at Charing Cross. We are not lacking a multitude of counsellors, and many of them are very clever, but the initiation lies largely with the London County Council. Surely some concerted

and powerful public opinion could be aroused to support the Council in some auspicious direction for the greater grandeur and beauty of London.

WE should be glad to see **Blackheath**, more of such publications of local interest as the excellent little monograph on Blackheath by Gerald L. Baker which is admirably printed in good large type and contains many dainty illustrations in pen and ink by the author. Professor G. de Montmorency in his foreword refers to this area as possibly the longest inhabited area in Britain: it has certainly witnessed the lives of a marvellous array of distinguished people. To architects Morden College and Greenwich Hospital are of themselves enough to give it distinction; but even in these crowded and degenerate days there is still a good deal of natural charm left on the Hundred of Blackheath which is referred to in Domesday Book as the "Hundred of Grenviz."

GENERAL NEWS

New Partnerships.

Mr. G. H. Foggitt, A.R.I.B.A., A.R.C.A., formerly of 84, Albion-street, Leeds, has entered into partnership with Messrs. Chorley & Gribbon, F. and A.R.I.B.A., of 3, Park-place, Leeds, at which address their practice will in future be carried on under the style of Chorley, Gribbon & Foggitt.

Exeter Town Planning.

Exeter is adopting a comprehensive town-planning scheme, covering about 8,000 acres.

Custom House Extensions at Dover.

To cope with the heavy import of silk goods and other dutiable articles, new warehouses are to be built at Dover.

New Dock for Tilbury.

The Port of London Authority have decided to construct a new entrance lock at Tilbury Docks at a site about 1,200 ft. above Tilbury Ness, at a cost of £1,680,000.

Housing Loans Order.

The Minister of Health has issued a new Housing (Loans by County Councils) Order, 1925, dated July 25, 1925, under section 94 of the Housing Act 1925.

Tottenham Housing Scheme.

In a recent report the Housing Committee of the London County Council outline a scheme for the erection of 346 houses and flats and nine shops on the White Hart-lane Estate, Tottenham, at a cost of £239,693.

Hastings Bathing Pool Scheme.

Hastings Town Council has approved the scheme for the provision of a bathing pool at West Marina, at a cost of £25,000. The pool will be 200 ft. long and 66 ft. wide. There will be seating accommodation for 2,000 people.

Trafalgar Square.

The asphalt surrounding the fountain basins in Trafalgar-square is to be taken up and replaced by stone blocks about 5 ft. 6 in. square; this was the original scheme of Sir Charles Barry, from whose design the square was originally laid out.

Mediæval Kitchen at Hampton Court.

Henry VII's great kitchen at Hampton Court has recently been opened to the public for the first time. It is said that this kitchen is the least modernised mediæval kitchen in England. Its most prominent features are three immense stone-arched fireplaces, one of which still retains its original roasting fittings.

Birmingham Building Exhibition.

The Birmingham and Midland Building and Allied Trades Exhibition (including Public Works and Road Making Section) is to be held at Bingley Hall, Birmingham, from September 7 to 19. The Exhibition presents a good opportunity to all interested in the building and allied trades of displaying their productions to architects, builders and others.

Guards' Memorial, St. James's Park.

Construction work on the site for the Guards' Division Memorial in St. James's Park has begun. The design is the outcome of collaboration between Mr. H. Chalton Bradshaw, the architect, and Mr. Gilbert Ledward, the sculptor, and takes the form of a Portland stone pylon, along the front of which (facing the Horse Guards' Parade) are five figures, each representing one of the Guards' regiments.

New Bridges Across the Thames.

Middlesex County Council has recommended that the Joint Committee of the Middlesex Council and the Surrey County Council should proceed with the scheme for the proposed new

bridge over the Thames at Hampton Court. The Ministry of Transport has been applied to for a grant towards building the proposed new bridges over the Thames at Chiswick and Richmond.

Limehouse Housing Scheme.

Stepney Borough Council propose to carry out an extensive housing scheme on an area known as Limehouse Fields. The scheme involves the demolition of over a thousand small houses and the erection of blocks of flats ten stories high. The tenants, however, are vigorously protesting against the scheme, which, they allege, will mean the ruin of the fish-curing industry, now carried on in small outhouses.

Wollaton Hall.

Nottingham Corporation has now entered into possession of Wollaton Hall, the historic Elizabethan home of Lord Middleton, with the surrounding park of 800 acres. The purchase price was £200,000, but the Estates Committee of the Corporation estimates that it will recover a considerable proportion of this sum by selling parts of the park fronting the main road from Nottingham to Derby as sites for houses of a good class.

Archæological Find.

An archæological discovery of considerable importance has been made at Freshwater West, near Pembroke, where a cinerary urn has been found deposited in a small chamber within a tumulus. The receptacle was completely covered over by a large flagstone, inscribed on which a rudely-patterned cross of unusual design could be distinctly discerned. The urn when examined contained bones which Sir Arthur Keith, the surgeon, dates at about 1200 B.C.

INCORPORATED CHURCH BUILDING SOCIETY

At the last monthly meeting of the Incorporated Church Building Society, held at 7, Queen Anne's Gate, Westminster, the Hon. Sir E. P. Thesiger, K.C.B., in the chair, grants were made towards building new churches at: Claremont, The Holy Angels, £200; Silvertown, West, S. Barnabas, £400; and Welling, S. John, £300. Towards enlarging or repairing the churches at: Almondsbury, S. Mary, £50; Birkenhead, Holy Trinity, £25; Bourne, The, S. Thomas, £200; Bratton, S. James-the-Great, £30; Bromsgrove, S. John-the-Baptist, £50; Charlton, Old, S. Luke, £35; Churchstanton, SS. Peter and Paul, £25; Colnbrook, S. Thomas, £50; Gaywood, S. Faith, £270; Hackney, West, Parish Church, £50; Hartlepool, S. Hilda, £350; Henlow, S. Mary-the-Virgin, £50; Kidlington, S. Mary-the-Virgin, £40; Kilburn, S. Paul, £40; Llanddwywe, S. Dwywe, £20; Loxton, S. Andrew, £40; Manaton, S. Winifred, £125; Puriton, S. Michael and All Angels, £20; Rowledge, S. James, £15; Sutecombe, S. Andrew, £20; Tattershall, Holy Trinity, £50; Taunton, S. Mary Magdalene, £150; Thaxted, S. John-the-Baptist, £100; and Worstead, S. Mary, £25. A grant was also made from the Mission Buildings Fund towards the erection of a mission church at Hallsall, S. Aidan, £60.

The following grants were also paid for works completed at: Alverdiscott, All Saints, £25; Bloxham, S. Mary, £50; Cheddington, S. Giles, £40; Ellesmere Port, Christ Church, £75; Epsom, S. Barnabas, £50; Gaywood, S. Faith, £100; Hanslope, S. James, £125; Lambeth, S. Philip, £10; Luton, S. Nicholas, £40; Melverley, S. Peter, £75; Minster, S. Peter, £30; Newport, S. Andrew, £50; New Shildon, All Saints, £25; Ruishton, S. George, £50; Shotton, S. Ethelwold, £75; and Skelmersdale, S. Paul, £105.

In addition to the above, £495 was paid from Trust Funds towards repairs to twenty-five other churches. With this meeting, the Society has granted £6,825 during the current year. Funds are now urgently needed to continue and extend its work.

COMPETITION NEWS

Public Baths and Washhouses, Chaddert.

The D.C. are inviting the submission of competitive designs for new public baths washhouses to be erected at White. Architects are to be instructed to provide the possibility of only a portion of the scheme being proceeded with at present. The estimated cost of the full scheme is £60,000.

Shirehouse Extension, Norwich.

The assessor in this competition, Mr. G. Pinkerton, F.R.I.B.A., has made the following awards:—1st (premium £150), Mr. A. Dun Smith, F.R.I.B.A., London; 2nd (premium £100), Messrs. Langman & Richardson, Southampton; 3rd (premium £50), Messrs. Kieff Fleming, London. Designs are now on in the Blackfriars Hall, Norwich.

Proposed Parish Hall, Braunton.

We are informed by the Secretary of R.I.B.A., that members must not take part in this competition because the conditions are not in accordance with the public Regulations of the Institute for architectural competitions.

Model Workers' Homes, Moscow.

We have received particulars of an international competition (First Contest) for designs for model workers' homes, Moscow, which has been promoted by the Moscow Soviet of Workers' Peasants, and Red Army Deputies. Various types of houses are required, and the following prizes are offered:—

	Roubles.	
	A.	B.
1. ..	2,000 ..	2,000 ..
2. ..	1,500 ..	1,500 ..
3. ..	750 ..	750 ..
4. ..	500 ..	500 ..
5. ..	400 ..	400 ..

A document supplied to us by the U.S. Society of Cultural Relations with Foreign Countries, 150, Southampton-row, London W.C.1, and giving full particulars of the competition, may be seen at our office. The date for entries is October 15, 1925.

Memorial Pulpit, Boscombe.

The design submitted by Sir Giles Gil Scott, R.A., for a marble memorial pulpit to the late Father de Lapasture, S.J., in the church of Corpus Christi, has been awarded first place in this competition.

MANCHESTER ART GALLERY: THE LIGHTING OF THE WINNING DESIGN

By S. HURST SEAGER, F.R.I.B.A.

In *The Builder* of June 26 was a criticism of the winning design for the Manchester Art Gallery, published in the two previous numbers. It referred to the lighting of the upper galleries as a modified form of the Hurst-Seager Method, and the author of the winning design himself has referred to it as a modified form of the top-side-light. It is perhaps gratifying to find that it is at last recognised that the old central ceiling must be abandoned, but it is disappointing that the fundamental principle of the top-side-light has not been realised—that the method is, in fact, "modified" to such an extent that it would fail to effect the purpose intended. The conditions state:—

"Very careful consideration must be given to the lighting of the galleries, and in top-lighted rooms the light should be so devised that it is thrown mainly on the walls, and not on the floor, and so as to avoid reflections in the glass of the pictures."

The author of the winning design tells us that this most important condition has been fulfilled, but while he must be given credit for the attempt, it should be pointed out that what he suggests in the sections would fail to give the effect desired. The conditions do not state the amount of light that should fall on the walls on a dull day, but it was with reason assumed that enough would be provided to see the pictures properly; nor do they ask for lighting diagrams; had they done so the deficiency of the lighting would have been apparent.

Fortunately, the very method proposed in the design placed first has actually been carried out, thereby providing an immediate test. The architects claimed that they had adopted the top-side-light, and it was necessary for me to point out that the top-side-light had not been installed; a section of the gallery was published, and in conjunction with it a diagram of a top-side-lighted gallery. It was thought that all who had occasion to study the subject would see at once why it could not possibly lay claim to being top-side-lighted and why it could not possibly be successful.

In the sections for Manchester it can be seen that there is practically no direct lighting from the sky on to the picture plane. The main direct lighting from the sky loses itself on the flat central ceiling, and is there scattered. This scattered light enters the gallery at a very acute angle, through a horizontal or lay-light close to the wall, with the result that both the spectator and the picture would be in a very subdued light of nearly equal value. The wall, except the top of it and the cornice, is not better lighted than the spectators, and reflections in the glass of the pictures would be dominant. In the executed example, the room was found to be so gloomy, even though there were no lay-lights to reduce the intensity, that the solid ceiling was removed, and the flood of light thus sent down on to the spectators, while dissipating the gloom, did not increase the relative amount of light on the picture wall, and the reflections can to-day be seen dominant in all glazed pictures.

That the solution cannot come in the attempt to give better light to the picture by placing ceiling lights close to the walls was pointed out (quoted in my R.I.B.A. article of January 13, 1923) as long ago as 1853 by the Messrs. Papworth in their book on "Picture Galleries." On page 70 they state:—

"Pictures have, as is well known, a tendency (especially if dark, highly varnished, or covered with glass) to reflect the light objects near them. This mirror-like tendency will be found to be greater, wherever the windows may be placed, in proportion as the light on the picture is weak. It may be further remarked that the inconvenience in question is not to be counteracted by placing the skylights next the

walls (an arrangement objectionable on other accounts), for under such circumstances the light on any object near the picture is necessarily fuller and brighter, whereas when the lights are nearer the centre of the room, such objects present their shadowed sides to the paintings, which have thus less to reflect."

In the studio of Sir John Soane's Museum there is an excellent example of the truth of this statement, for there, in a small, low room having skylights at the sides and a very wide solid central ceiling, the shade cast is above the heads of the spectators, and therefore would not prevent reflections in any glazed pictures placed on the walls, even though the ceiling is only a few feet above them. The same thing is to be seen in all the galleries where it was thought that the desired effect could be obtained by merely dividing the *top light* and pushing each half of it against the side walls. The fundamental principles of the top-side-light, by which alone a successful result can be achieved, are:—

1. That the light falling upon the picture shall be from one source only.
2. That the source of light shall be invisible to the spectator when standing in the proper position for viewing the picture.
3. That the picture wall must be the best lighted part of the room.
4. That the spectator must be in a subdued light, having a ratio (as shown by my tests at Wembley, the Wallace Collection, and the Fitzwilliam Museum, published in *The Builder* and R.I.B.A. Journal) of 1 to 5 F.C., dependent, of course, on the relative reflective factors of the picture and the objects.
5. The walls of the gallery must be far enough apart to permit tilting of the pictures, in order to avoid reflections of those on the opposite wall, as shown by my diagram in *The Builder* and R.I.B.A. Journal.

I am aware that the Manchester conditions, by limiting the width of the rooms, ask 1 for the impossible. By the preparation of lighting diagrams, which in all cases should have been drawn, it could have at once been shown that the two clauses—the width of the room and the maximum of light on the walls—contradicted each other. It will be seen that the upper galleries at Manchester do not conform in any particular to the requirements for their efficient lighting. It is not merely a question of altering the form of the skylights. Radical changes would have to be made.

With regard to the lighting of the museum galleries in the winning design (Manchester competition), the lofty side-lighted rooms on the exterior have their windows far too low. The sills are only about 4 ft. from the floor, and the heads are no less than about 8 ft. from the ceiling. The most valuable light in all side-lighted rooms is that which falls from the upper part of the room, and all the light which enters it below the level of the eye, and some distance above it, is worse than useless. It brilliantly illumines the spectator and causes a bright and confusing dazzle. Very bright lights and dense shadows are cast near the windows, and only a feeble light is obtained on the other side of the room. There is no diffusion, for the ceiling, which might act as a good diffusing reflector, is in complete shade.

That the lighting of museums from one side only, even if the windows are close to the ceilings, is not successful, can be easily determined by numerous examples everywhere. The best lighted museum gallery of which I know in London is the Science Museum at South Kensington, where there is a large skylight, single glazed and high side lights on both sides. The cases have their glazed tops above the level of the eye and take the reflections of the skylight without any inconvenience. The

FIG. 1.—DECORATIVE ARTS GALLERY, NEW YORK METROPOLITAN MUSEUM, "SHOWING WELL-LIGHTED ROOM WITH HIGH LUNETTE LIGHTS AND WHITE CEILING."

Science Museum at Berne is also lighted in this way, and has high glazed cases, and the effect is admirable. The Museum at St Germain, near Paris, is also excellently lighted by high windows on both sides, and where horizontal cases with the tops below the level of the eye are used, this form should be adopted, as the exhibits can be perfectly seen without any reflection in the glass of the cases.

Again, the side-lighted rooms opening on to the east and west, or long sides of the light area, would be found to be deficient. The court is only 40 ft. wide, and the angle formed by a line drawn from the heads of the windows of the Museum rooms on the "first floor" to the top of the parapet is 35 degrees. I have tested in San Francisco the light area of the City Hall, and give a section of the test I have made (Fig. 2). It will be noted that the angle subtended from the heads is within a degree or two of the angle seen in the section of the Manchester drawings, and it affords absolute proof that the lighting of these rooms would be inadequate.

Side-lighted rooms with the low windows are the very worst for glazed pictures and for general museum exhibits, as I endeavoured to show in my paper, "Recent Developments in Gallery Lighting," in the R.I.B.A. Journal, December 20, 1924.

In every case where side-lighting is desirable, top-side-lights should be used, and they might most easily be arranged at Manchester by embracing for the picture galleries the whole of the width of the available space from wall to wall, and forming with bays the rooms required. In this way the light is over the head of the spectator on entrance. All the objects in the room would be well seen, for they are illumined on the side next to the spectator, and, not as at Wembley, on the side distant from his point of view—with the window causing a glare in his eyes and making the contrast the lighting of the objects appear dull.

The Builder has already pointed out the inadequacy of the lighting in various parts of the building, and rightly questions the efficiency of the lighting of the Sculpture Gallery. The late Mr. Statham stated in one of the discussions at the R.I.B.A. that the nearer you approached the conditions of top-side-light, the better the sculpture would be lighted, and this truth is demonstrated at the Central Sculpture Hall at the Grand Palais, Paris. There, it will be remembered, the whole of the vast roof is of glass, shielded by a white muslin valarium, giving a soft, well-diffused light, in which all the subtle modelling of the sculpture is admirably seen. But high side lights close to a white ceiling also give

cellent results, as can be seen at the decorative Arts wing of the Metropolitan Museum in New York, illustrated in Mr. Brewer's paper in the R.I.B.A. Journal of April 12, 1913, and by the illustration (Fig. 1) accompanying. This hall is 67 ft. high to the crown of the vault, and 43 ft. to the ringing at the sills of the lunette windows, placed fairly close together and extending the whole length on each side. I can confirm what Mr. Brewer has stated, that "no doubt the east height and area of white wall below are largely responsible for the beautiful, soft, diffused light, which floods every part of it." The axis is north-east-south-west. My visits were made on a bright morning, when the sun was shining on the north-east side. Narrow galleries run across each end, and the end walls of the room are in the planes of their balustrades. On the balustrade, some 15 ft. below the windows of the South-west Gallery and at the south-east end, the lighting was over 100 F.C., and at the north-west end 100 F.C. At this height the light on the bright north-west wall was 80 F.C. and 20 F.C. on the south-east wall, while at 5 ft. from the floor level the north-west wall was 30 F.C. and the south-east 15 F.C. The light on the floor itself varied from 50 F.C. on the north-west side to 15 on the south-east. These readings would, of course, be reversed in the afternoon. The lighting was not a degree too bright for sculpture, furniture, and other works of art exhibited. Here is an example with

which the proposed Sculpture Hall at Manchester can be compared. It confirms *The Builder's* impression, for it says: "It is just a question if the lighting of this important feature is quite adequate; certainly it is not superabundant."

At New York the vaulted ceiling is of plain plaster, and the five lunettes, which are about 2 ft. less than half the height of the wall from the floor to their sills, go up to within a few feet of the crown of the vault, giving, therefore, a perfectly lighted reflecting surface. At Manchester there are only three lunettes, having a height equal only to about 2 ft. more than one-third the height of the wall, and their crowns about 7 ft. below the crown of the vault. The light, therefore, on the vault would not be as bright as at New York, and because it is coffered, much of the ceiling would at all times be in shadow, and its value as a reflecting and diffusing surface would thereby be reduced.

The windows shown in the recesses are worse than useless. You have only to try to examine the sculpture placed under the windows in St. Paul's Cathedral to realise the impossibility of seeing sculpture when the side towards the spectator is in dark shadow and the light of the window is in his eyes. The lighting, although considerably diminished, would be infinitely better if these windows were omitted. Moreover, at each end at Manchester there are wide galleries covering the floor of the hall, but there are no windows

within about 22 ft. of the ends, and consequently the space under the galleries would be gloomy indeed, and the galleries themselves would be not well lighted.

The Builder rightly states that "any deficiency, however, could be more than met by top-lighting, although this might destroy to some extent, unless most carefully handled, the monumental character of the coffered vault." Judging from examples elsewhere, I am of opinion that if the coffers are made deep enough so that the glass shall not be visible, unless deliberately looked up at, that this treatment would be most successful. Skylights deeply coffered are in one of the sculpture galleries at the Vatican, so that while the glass cannot be seen, a flood of light falls and the vertical sides of the coffers act as good diffusers with excellent results.

Turning to the print room, many print rooms and galleries have been built with such lighting as there shown, and all are failures. There is in *The Builder* (July 4, 1924) the section of a gallery adopted by M. Bigot for the St. Quentin Museum, which should be used in all cases where close examination of prints, small miniatures, or small pictures is desired.

It is a sorry task to have to point out these defects of lighting in an otherwise excellent design. In the criticism in *The Builder* (page 968) it is stated that "It can be said at once that the disqualification of this brilliant design would have constituted a tragedy." Everyone must share in the regret that the conditions were prepared in such a way that a good solution to the problem could not be offered without breaking them.

BOOK REVIEW

How to Look at Old Churches. By H. SPENCER STOWELL. (London: Methuen & Co., Ltd.) Price 5s.

This little book has been written for those who have no technical knowledge of architecture, but who desire to take an intelligent interest in old churches. For this reason the book does not make any pretence to be more than elementary, and the style of writing is both simple and consistently free from abstruse technicalities. With one or two rare exceptions no attempt has been made to suggest ideas or to stimulate the imagination; it is a plain statement of evidence and details. The author confines his study of church architecture to an examination of the Gothic style, and leads up to the subject through the Saxon and Norman periods. In one of his rare excursions into the realms of architectural philosophy the author observes that the window tracery of the Decorated period was twisted into patterns for their own sake, and that, as the original constructional meaning was lost, it was a sign of deterioration. We question this. We grant the constructional problem of the arch of the window, but we are inclined to accept the tracery as a deliberate attempt (and a legitimate excuse) to produce sheer beauty by means of intricate lacework. It is more to the point, we think, to note the development from the actual shape of the lights to the stonework which separated the lights. We do not remember having seen the term "Crockett" applied to a form of ornament in the position indicated in one of the sketches. There is no doubt that this little book will answer the purpose which the author had in mind. The historical and architectural developments are clearly and simply traced, and are supplemented by many excellent sketches.

FIG. 2.—SECTION THROUGH LIGHT WELL OF SAN FRANCISCO CITY HALL.

This section shows the same angle from the top of the obstruction to the head of the lower windows as at Manchester. The readings were taken on a bright sunless morning at the windows looking north. Although the light 4 ft. from the window is 50 F.C., it diminishes rapidly that at 18 ft. away it is only 1.5 F.C. Two lots of readings were taken—one with the meter held vertically at 5 ft. from the floor, opposite the window, and one with the meter held horizontally at the height of 3 ft. from the floor. The central readings in each were taken just within the line of obstruction; that is, when the sky disappeared.]

CORRESPONDENCE

[While we are glad to publish letters on professional and other matters of interest to our readers, it must be understood that we do not necessarily endorse the remarks of correspondents, who will oblige us if they will express their views as briefly as possible.]

New York Cathedral and Some Modern Theories.

SIR,—It seems to me that your correspondents miss the centre of the target at which they aim. Mr. Randolph would hold up Dr. Cram's New York cathedral design as satisfactory, and the writer of the original article seeks to support his view that it is far otherwise by explaining that we can never emulate the mediæval builder because we cannot address ourselves to building in the same spirit and with the old guild organisation, and by asserting that as we cannot emulate it, we ought to eschew the Gothic style altogether. This seems a wearisome field of exploration to those whose aspiration it is to build beautifully, for anyone would be likely to there discover equally good reasons for wiping out also the whole grammar of classic and Renaissance architecture, and with a little thought and verbal ingenuity, the activities of the sculptor and the painter as well. I write in the belief that most of your readers will agree with neither disputant. Among a representative group of our younger architects, whose conception of the motives of human activity have been tainted with the spiritual effluvia of the times in which they live, Dr. Cram's design for New York Cathedral is probably received with a smile and a shrug. The same group reconciles itself to conceding merits to Liverpool Cathedral by attributing those merits to the influence of Imperial Rome; it will not swallow a masterpiece of Christian architecture unless it sweetens the draught by telling itself—on the principles of M. Coué—that it is of pagan origin. The disapproval of his design by those who think after this fashion might well be accepted as a back-handed compliment by Dr. Cram. We need not concern ourselves with prejudices of this kind. The only criticism which is admissible is that which is in sympathy with Dr. Cram's aims and not that which is estranged from them.

American architecture is held in high esteem in England. Those who feel as I do, think that it is among the best things that belong to America. We all recognise the scholarship and high attainment of American architects; and we admire and envy the breadth of conception, the freedom, the eclecticism, the adequate realisation of magnificent opportunity displayed in American architecture; but we find none of these admirable qualities in Dr. Cram's design. It is not free, but fettered with tradition; breadth of conception exists only in the circumstance of bulk; eclecticism is absent, for the individuality of the architect finds no expression in the design; and opportunity, which has rarely been surpassed in the history of the world, is in no way adequately realised, for the design is in all respects, except that of its central tower, a reproduction of ideas which have long been common property, which are staled by long acquaintance, and which express no sense of an individual whole because every part is reminiscent of some other thing already familiar. I do not lose sight of the fact that America has no traditional mediæval architecture, or that the idea of setting up a scholarly representation of the finest achievements of Gothic builders may have reference to that fact; but the building will not represent the achievement of Gothic builders, and it will be a failure.

If anyone doubts this let him come to England and see the results of parallel attempts here; let him view the masterpieces of the late Sir Gilbert Scott, whose buildings I cite as being the best examples we have of the principles governing Dr. Cram's design. That design depicts America as about to give herself up to practices which have been proved retrogressive here; she is setting out to do what we left off doing fifty years ago when the eclecticism of Street and Pearson first showed what Bodley, Butterfield and Bentley afterwards established,

namely, that Gothic architecture subsists, not in the manipulation of its recognised forms, but in the spirit of its intent of building. No Gothic builder ever reproduced what had already been done, but adventured, always, from the point last gained. New York Cathedral consists entirely—as regards its conception and apparent purpose—in nothing but a re-arrangement of recognised forms, and a reproduction of what already widely exists, so that the very principles governing its inception are in direct opposition to the principles of the builders whose achievements it seeks to emulate. A man might as well seek a revelation of the genius of Shakespeare by staring at his wax effigy at Madame Tussaud's Exhibition, as hope to comprehend Gothic architecture by studying the churches of our elder Scott and his contemporaries; and the spirit of mediæval builders will dwell in the aisles of New York Cathedral only as the soul of a dog lives in the glass case that contains its stuffed hide. I do not say that America could not perform the miracle to which Dr. Cram aspires if that miracle were possible of attainment, but it is not. The proposal is saddled with a double impossibility. A cathedral cannot be built in the Gothic tradition because craftsmen versed in that tradition are not available; but even if such craftsmen existed and New York Cathedral were authentically built in the pattern designed for it, the building would still be a failure because it would be a sham; it would merely be a skilful copy instead of an incompetent one. An aspiration to copy never produced a reputable work of art in the history of the world, as is abundantly proved by the deplorable results of all attempt of the kind, and by the fact that no artist or craftsman ever reproduces his own or another's work, which he certainly would do if that were the road to attainment and not the road to failure. We cannot build as men built in mediæval times because we do not think and feel as those men thought and felt, and because we are, in certain essentials, far inferior to them. One of the most vigorous and decisive ways of demonstrating this ignoble fact to all beholders is to invite comparison by reproducing badly, with difficulty, and self-consciously, what they did easily, spontaneously and supremely well. This is all that the great gifts of Dr. Cram, supported by the best intentions of everyone, can hope to accomplish. So far as I am aware the idea of expressing reverence for great works of art by making indifferent copies of them is of modern origin. I recall no usage of the sort earlier than the middle of the eighteenth century, and I am inclined to think it a heritage of that industrial revolution which bemused the world with the slick facility of reproductive machinery. No craftsman ever reproduced himself or others; and the whole history of architecture up to two hundred years ago, is one of adventure in building. That spirit of adventure—the instinct to art—is the aspiration that directs the impulse to all right architecture to-day, and is the motive which alone has ever produced, or ever will produce, memorable building.

H. B. CRESWELL.

EXHIBITIONS AND THE ARTS OF DISPLAY *

The Director of the United Kingdom Exhibits in the British Empire Exhibition has brought together his experiences and results of the Wembley Exhibition. Problems and difficulties are discussed from the managerial and the competitors' point of view, and the results are shrewdly commented upon by the author. The book is packed full of information upon the various commercial factors which have been studied and reconciled, and on this score alone it is safe to prophesy that exhibitions of the future will gain considerably if this book is studied and taken as a guide.

The exhibitors' points of view are interesting up to a point only, and it is when we come to the

* By Sir Lawrence Weaver. (*Country Life*.) 30s. net.

root of the problem that we realise what an enormous amount of hard work and tactful pressure must have been necessary to convince the sceptics that they had much to learn about art and display. In its wider sense this book opens up a new philosophy—the relation of art to commerce and advertisement. The type of architecture especially suitable for exhibition pavilions should occupy an important position in any philosophy concerning art and advertisement, and it is therefore a disappointment to read that the author has resisted the temptation to discuss the various buildings. It would be difficult to think of anyone who could do it better. "An exhibition," he remarks, "should be conducted in a spirit of reasonable gaiety, and while we agree with this, we are left in considerable doubt about some of the building which struck a dominant note of austerity and dignity. The idea is enlarged on in the chapter upon pavilions and kiosks. "If exhibition cannot give opportunity for an architecture of adventure and humour, they lose some of their virtues." Again we agree, and again we find it difficult to reconcile the ponderous gravity of some of the buildings. We feel that the mixture of dignity and gaiety at Wembley was confusing, but symptomatic of different conceptions of the abstract idea to be conveyed in exhibition architecture.

The relationship between art and commerce has drawn perceptibly nearer during the last few years, and the author's opinions on the subject are bound to carry considerable weight. We cannot hazard a guess whether his philosophy has altered; we accept the value of any theories which are the fruit of practical experience and understanding brought into contact with certain definite æsthetic ideals. Exponents of the compromise and no-compromise schools will realise some of the difficulties as they read this book and assimilate both sides of the problem. "I used to be supposed that there are two kinds of arts, 'fine' and 'applied.' Fine arts are things standing by themselves without relation to life or any human concern, nor are other sorts of arts 'applied' to common things, as jam applied to dry bread to make it more attractive. . . . There is no kind of art which is too good to be used in the service of industry and commerce, whether in giving beauty to common things or in making a pattern which publicists may use to commend those things. . . . There is no greater hope for the correction of some evil aspects of the industrial revolution than the whole-hearted devotion of Art to the service alike of manufacture and salesmanship, and then in the interest both of artist and business man."

This is well said. We have no quarrel with the general principles underlying the relationship of art to commerce, but we realise that it is purely a matter of how far we are prepared to follow the advertising movement—a movement which has come to be accepted as a corollary of commercialism. One aspect of the commercial art problem moves by easy stages into the advertisement section, until we begin to question the ethics of the means in relation to the ultimate ends. The advertising side of commercialism must be faced, and it is frankly faced in this book. When we read this—believe the main commercial aim of a great exhibition should be publicity rather than sales—we are in possession of a definite philosophy, and we realise the value of it which we think what Wembley might have been. The moral apparently is this: If we are going to have trade displays, let us make them as decent as we can. In many ways we can see that the Wembley Exhibition must have achieved a great deal (the popularising of seemingly lettering is of them), and this book will enable us to continue the education at our leisure. The book is well illustrated by numerous photographs in colour plates.

Roman Remains at Kingston.

The Earl of Crawford and Balcarres, K. President of the Society of Antiquaries, recently opened the newly-discovered Roman remains at the Kingston Baths site.

New Fire Brigade Station, Peckham, S.E.

The new Fire Station which we illustrate this week has just been completed in the Peckham-road from designs prepared in the Architect's Department of the L.C.C. under the personal supervision of Mr. G. Topham Forrest, F.R.S.E., F.R.I.B.A., F.G.S., Chief Architect to the Council, to replace the obsolete station in the same neighbourhood. The site is situated at the corner of Peckham-road and Talfourd-road.

The building, being the first new station since the shift system came into operation, has been planned on new lines to meet the changed conditions. The only residential quarters provided are those for the station officer.

The main block consists of a basement, ground, first and second floors. On the ground floor is the appliance room (28 ft. wide by 36 ft. deep—in which a motor pump and motor escape are housed) with the watch room and office opening from it. Access to these apartments and to the staircase is obtained by a side entrance from Talfourd-road. The run-out is on the Peckham-road front. The first floor accommodates the shift men, whose quarters comprise a mess room, recreation room, locker room, lavatory, bathroom, store, and a room for the sub-officers.

The station officer's quarters on the second

floor include a living room, sitting room and two bedrooms, with scullery, bathroom, w.c., and store cupboard. Sliding poles give quick access to the appliance room from the two upper floors. In the basement are the wash-house, drying room, battery room, boiler house, and fuel stores. A large drill yard is provided in the rear, having a separate run-out into Talfourd-road, and is equipped with a drill tower, pumping well and hydrant. The drill tower contains a space for drying hose. Around the yard are placed the canteen, a workshop, and stores for petrol, oil, wood, cycles, &c. There is a motor pit in the appliance room for the inspection of appliances. The building is heated by a low-pressure hot-water heating installation, a new feature being the placing of radiators in the appliance room floors beneath the appliances. The facings are of multi-coloured red bricks with stone and Crowborough brick dressings; portions of the upper story being plastered. The roof to the main building is of sand-faced red tiles. The contractors were Messrs. Wm. Downs, Ltd., and the contract amount £9,152.

District Baths, Hillsborough, Sheffield.

This building is one of several new public baths projected by the Corporation for various districts in the city. The work is included as part of a scheme for the relief of unemployment, and to comply with Government requirements a system of reinforced concrete construction has been adopted throughout, the central portion only of the main front being faced with local stone. With the exception of the brick chimneys the remainder of the work including pile foundations, walls, subways, pond, floors, stairs, gallery and roofs are reinforced concrete framework consisting of stanchions and beams with infilling of pre-cast blocks or reinforced panels.

The work was designed by and is being executed under the superintendence of the City Architect, Mr. F. E. P. Edwards, F.R.I.B.A., the consulting engineers for reinforced concrete structural details being the Considère Constructions, Ltd., Victoria-street, London, S.W.1. The general contractors for the structure are Messrs. G. Longden & Sons, Ltd., Sheffield; the engineering work being by the Brightside Foundry & Engineering Co., Ltd., Sheffield, and the filtration plant by Messrs. Bell Bros., Ltd., Manchester. The estimated cost of the complete work is about £32,500. The clerk of the works is Mr. F. W. McInnes.

Middlesbrough Technical College Competition : Winning Design.

We illustrate this week the design placed first in the recent competition for Constantine Technical College, Middlesbrough, the success-

ful architect being Mr. Graham R. Dawbarn, A.R.I.B.A. The assessor, Mr. Percy Thomas, F.R.I.B.A., in his report to the Governing Council of the College says: "Design No. 1 is an admirable solution of the problem. The planning is simple and direct, and by compactness of arrangement the author has been able to produce a design which has probably the smallest cubical contents of any in the competition, and which I have no doubt can be erected within the figure stipulated by your Council."

The winning competitor in his report says: "It is considered that elaborate stylistic façades are out of place in Middlesbrough." The external treatment is intended to express the function and construction of the building. The need for economy has been considered throughout. It is noted that some of the public buildings at Middlesbrough, such as the Custom House and Town Hall, have weathered a very depressing colour and already show slight signs of decay. It is therefore suggested that the Technical College be faced with Portland stone. Grey Norwegian granite is suggested for the plinth. It is assumed that this could be shipped direct to Middlesbrough. As a contrast, the main entrance would be formed of white synthetic marble. Metal casements and slate roof would be used throughout.

"The floors would be supported by naked R.S.J.'s, generally at 8 ft. centres. On these R.S.J.'s. would be placed reinforced concrete slabs. In classrooms, laboratories, &c., the finished floor would be of wood, laid on battens leaving a space above the concrete along which laboratory pipes would be led. In the halls, corridors, &c., and in the library and Principal's office the R.S.J.'s. would be cased in concrete or 'tee beams' of reinforced concrete would be used. The floors of the entrance hall and staircase halls on the ground floor would be covered with vitreous tiles, the remaining corridors, &c., and all workshops being finished with dustless granolithic. Some form of terrazzo would be employed for floors and walls in lavatories. In all cases the skirtings would be flush with the walls above and the floors coved up to meet the skirtings (wooden coves being used with wooden floors). Angles of walls would also be slightly rounded. The walls between rooms would be 4-in. slab partitions, thus enabling alterations in size and distribution of rooms to be made later on, without structurally affecting the building. The remaining walls would all be of local bricks. An internal colour scheme would be carefully considered. A clean fresh appearance would be aimed at, with occasional touches of bright colour to avoid the general depressing feeling inside such buildings.

"Provision is made for considerable future extensions. They are indicated on the plan."

Reredos, Gillingham Church, Dorset.

This is a new reredos for the high altar in the Parish Church of St. Mary the Virgin, Gillingham, Dorset. The illustration is from a water-colour drawing by the architect, Mr. H. P. Burke Downing, F.S.A., F.R.I.B.A., of Westminster.

Headquarters Offices, Nairobi.

This design was placed first in a recent competition for new Headquarters Offices for the Uganda Railway at Nairobi. The architect is Mr. F. Gordon McIntosh, of Pretoria.

Royal Archæological Institute at Newcastle.

The following corrections should be made in the account of this meeting in last week's issue:—P. 254, col. 3, line 13, for "Lyne" read "Tyne"; line 28, for "even" read "head"; p. 255, col. 2, line 10 from bottom, for "Geta" read "Caracalla"; line 9 from bottom, for "Caracalla" read "Geta"; col. 3, for "like fountains" read "as at Fountains Abbey"; line 21 from bottom read "a striking object; in the castle there is a fine collection," &c.; p. 256, col. 2, line 6, insert comma after "St. Hilda"; line 22, for "born" read "borne."

BRITISH ARCHÆOLOGICAL ASSOCIATION CONGRESS AT NORWICH—II

By P. H. DITCHFIELD, M.A., F.S.A.

Thursday, July 2.

On this day the members journeyed to Yarmouth, where they went to several places of interest, and were received at the Town Hall by the Mayor, Mrs. Leach, and the Mayoress, Miss Leach. The Civic treasures were displayed for their inspection, and from Yarmouth they travelled to Burgh Castle to view the remains of its Roman camp. They next proceeded to St. Olaves Priory, and returning to Norfolk visited Heckingham Church, during brilliant sunshine, the journey through cornland and woodland being delightful. On arrival at Yarmouth the visitors were met by Mr. R. F. E. Ferrier, Deputy-Mayor, President of Yarmouth branch of the Norfolk and Norwich Archæological Society, Mr. R. H. Teasdel, its hon. secretary, and Mr. G. J. H. Poll, assistant secretary, who piloted the party throughout the day.

ST. NICHOLAS' CHURCH, YARMOUTH.

Canon R. Aubrey Aitken, vicar, who received the travellers at Yarmouth parish church, said this fine church, begun in 1121 by Herbert de Losinga, first Bishop of Norwich, was finished in 1330. A feature of the church is the great width of the aisles, 43 ft. compared with the nave, which is about 26 ft. wide. Losinga built this church as part of a penance, fixed by the Pope, for having made a payment to the King to become Bishop of East Anglia. One he built at King's Lynn, one at Norwich, the Cathedral, and the third at Yarmouth. The greatest marks of his handiwork were found in the Norman arches. In 1250 the great aisles were added, and the chancel aisles in 1280, the last addition being the big transepts. Probably a Saxon church stood on the site of the church in the time of Edward the Confessor. When the Puritans got the upper hand they thought the church was too large for the Church of England, and partitioned it off by walls into three sections, one for the Independents or Congregationalists, another for the Presbyterians, and a third for the Church of England. At a time when the Prayer Book could not be used at their services, the most valuable portion of its communion plate was given to the church. In 1805, when the church was falling into decay, it was proposed to build a "beautiful modern church," but wiser counsels prevailed. In 1860, the real restoration of the church began, and over £70,000 has since been spent. Underneath the altar is a pre-Reformation altar stone marked with five crosses. The party next visited the Fishermen's Hospital, a short distance from the parish church.

FISHERMEN'S HOSPITAL.

This picturesque quadrangular low building, Mr. R. F. E. Ferrier said, was erected by the Corporation in 1702, and contains twenty small rooms on the ground floor, each with a sleeping room overhead for "decayed fishermen and their wives" above the age of 60. It was a charity supported by benefactions. King Charles II granted an annuity of £160, paid out of the Excise from the beer duty, as an equivalent for the duty paid by fishermen on the beer they consumed, but this ceased when the duty on beer was removed. In the cobbled yard of the Hospital, on a pedestal, is a figure of Charity, and above the inner gate rises a cupola within which is a figure of St. Peter, patron saint of fishermen. Formerly two wooden effigies of fishermen stood on either side of the entrance gate, but these decayed, and were removed. Each inmate receives 2s. per week in summer and 2s. 6d. in winter. The gate is locked at 9 p.m. by one of the inmates. The upper rooms have gabled fronts, all the windows are diamond paned, and the roof is of pantiles.

Mr. P. M. Johnson said it was a type of interesting buildings now disappearing, and he

felt grateful to Yarmouth for maintaining it in its original condition as nearly as possible. The cupola over the portico and the picture of a Yarmouth fishing boat were good examples of early seventeenth-century art.

TOWN WALL AND TOWERS.

Mr. R. H. Teasdel, in a description of the old town wall, also viewed near the church, said it was begun in the reign of Edward I, and not fully completed till the time of Richard II. The walls were constructed of rubble, composed of Norfolk flints and hard flat bricks, firmly cemented and faced externally with brick. The roofs of the towers were flat and covered with lead. The wall was 23 ft. high and 2,238 yards long, with ten gates and sixteen principal towers, several of which remain, but the gates are all gone. The building of the wall was followed by the sinking of a moat which was of great utility, as it was navigable for boats, and merchandise could be unloaded at any part of the town. The moat was bridged at each gate. In the reign of Henry VIII the Duke of Norfolk ordered all the walls to be "rampired" with earth and sand, and further strengthening works were carried out in 1569. A mount was erected in the centre 222 ft. long, which in 1588 was enclosed with a wall 20 ft. high, built of materials from the ruins of a charnel house in St. Nicholas' Churchyard. An inner wall higher than the town wall was also built, on which pieces of ordnance were placed later, and the gateways arched over inside. A castle or fortress stood in the centre of the town, with four turrets or watch towers, which in 1621 was pulled down. Row 99 formerly was known as Castle Row. In the reign of James I all the guns were removed, as the walls and towers ceased to be of military importance. During the Civil Wars the towers and gateways were used to imprison captured Royalists. The North West tower remains near the bank of the Bure, and the massive wall which adjoined it severely taxed the energies of the iconoclasts who pulled it down some years ago. All the towers and walls are now scheduled as historical monuments.

A REGICIDE'S HOUSE.

Mr. Teasdel pointed out a house in the Market place, which was occupied by Miles Corbett, one of the regicides who signed the death warrant of Charles I. He was Recorder of Yarmouth, and also its member for Parliament. At the Restoration he fled to Holland, but was persuaded to return, and was hanged, drawn, and quartered at Tyburn. He was a Norfolk man, and his parents lived at Sprowston, where on the day Charles was beheaded his father planted a tree to commemorate it.

YARMOUTH TOLL HOUSE.

Passing through Kitty Witches-row, only 2 ft. wide at its western end from King-street, one of

Coln St. Denis.

the hundred and fifty narrow passages that intersect the town, the party arrived at Yarmouth Toll-house, which dates from the thirteenth century. It has an open external staircase from the street to the first floor, where the main hall was, underneath having been the old prison or hold, with its horrible dungeon still preserved, which is a great attraction to visitors. It was here Sarah Martin, from 1819

Castleacre Priory.

to 1842, visited and taught the unfortunate prisoners in cells that were used from 1270-1879. The building was acquired by trustee 40 years ago, and is now used for the Municipal Museum. The Hall was used as a Council Chamber, and also as a police court and Court Court till the present Town Hall was built. Some beautiful windows were uncovered when the building was taken over. The remains of spiral staircase were also discovered, up which the prisoners passed from the dungeons to court for trial. King John granted the right holding a Borough Court, which continued to this day. Many scenes had taken place in the hall, especially with representatives of the Cinque Ports, who claimed authority in connection with the herring fishing, but Yarmouth would tolerate no outside interference and bailiffs, predecessors of the mayors, stoutly maintained their rights until a Cinque Port Baron was killed, and at length the local authority claim ceased. Yarmouth bailiffs held powers of life or death and so had the Record at Quarter Sessions. The death penalty was carried out for petty thefts, and the last man executed at Yarmouth was hanged on the North Denes a hundred and twenty years ago.

CIVIC RECEPTION.

At luncheon the party was joined by the Mayor, who was welcomed by the President and the Vicar. The Mayor expressed her pleasure to see members of the Society in Yarmouth, and the Vicar, who also acknowledged the greetings of the President, said Yarmouth was proud of Parish Church, which was regarded as the Church of all, Nonconformists and Churchmen alike, who were proud of its history. At luncheon at Hill's Restaurant, a visit was paid to Grey Friars Cloisters, part of a Francis establishment, attributed to Sir Wm. Gerbrier, dating from 1271, exhibiting some interesting groining and bosses, one representing a friar in conventual garb. The church occupied the end of Queen-street adjoining. The premises were extensive and reached to the river. First settled here shortly after 1226. Mr. F. R. Haward kindly pointed out the features of the cloisters and traced their history.

At the Town Hall the Mayor, attired in official hat and robes, extended the visitors a hearty welcome. Yarmouth, she said, some old bits that they would find attractive and the town would be glad of any suggestion from them to help to preserve them.

Mr. C. E. Keyser, President of the Association, thanked the Mayor for the opportunity given them to inspect the town's ancient charters, regalia, and plate, which the Town Clerk (W. Edgar Stephens) so interestingly described.

they all knew the great part Yarmouth had played in our history, and they were delighted to be able to visit the town and inspect its treasures.

ROMAN CAMP AT BURGH CASTLE.

Resuming the motor-cars, the party travelled to Burgh Castle, where the Rev. A. Hunt spoke on the Roman remains, imposing in their size and solidity. It formed a military station, known as Gariononum, 640 ft. by 413 ft., with an area of five acres. Its walls were 14 ft. to 5 ft. high and 9 ft. thick with bastions. Excavations had proved that there was a quay constructed at the water side for the landing of troops. Mr. Hunt said the walls were in excellent preservation, and he was deeply grateful to those who had prevented their demolition to secure road material, which had happened in several other instances, notably at Caistor, near Norwich. The Bastion towers were not bonded into the walls, but added later. There were seven or eight of these forts, which materially added to its defensive powers. Ten thousand troops were supposed to have garrisoned this part of the coast from Brancaster down to the Blackwater. An enormous number of burials had taken place behind the walls at Burgh Castle, and numbers of urns and coins had also been dug up. The camp was occupied from A.D. 287 to 410. With the retreat of the Romans in the latter year the buildings fell into desuetude.

ST. OLAVES PRIORY.

At St. Olaves a halt was made to view St. Olaves Priory, an Augustinian Monastery founded by Roger Fitz Osbert about 1236, in the reign of Henry III., and dissolved in 1546 in the reign of Henry VIII. The principal part of the ruins was removed in 1784. Mr. Ernest Kent traced the history of the Monastery, which, he said, was built on the site surrounded by bays and marshes, selected for the greater safety of its occupants. It had great possessions, at one time owning 13 parishes in Norfolk and 14 in Suffolk. Dr. W. A. S. Wynne had done much diligent investigating work from 1904 onward and prepared a fairly complete plan of what the building had been. The Refectory, which is standing, shows the type of architecture, and Mr. Kent pointed out what an immense weight slender columns had supported in wonderful fashion, for 430 tons of masonry had been moved from the roof above. The remains are now under the care of the Board of Works Department.

ST. GREGORY'S CHURCH, HECKINGHAM.

After tea at St. Olaves Hall, the motors were turned, and a last halt made at St. Gregory's Church, Heckingham, a small church with a tower and thatched roof. It has a fifteenth-century font, with a massive bowl, most unornamented, square, supported on a central octagonal pillar, with a square base, and four circular shafts at the corners. It had a tasteless seventeenth-century cover, now decayed and unfit for use. The Bible on the reading desk is a huge volume, dated 1717, which is still used. The principal feature is the Norman doorway at the entrance. The President said it was one of the finest of the series of doorways found in the little churches all the way between Beccles and Norwich. This particular doorway possessed all the special features of such doorways, and he described its ornamentation of a series of medallions, then cone-shaped, and cheese moulding, every part full of ornamentation. If this was a conventional church formerly, it was probably rich, and could thus afford all this carved work. The Rev. P. E. Lance, vicar, showed the visitors round the church. The party then returned to Norwich.

In the evening, at the Technical Institute the Rev. A. Hunt lectured on Burgh Castle and the Roman occupation of Britain. Mr. Hunt said that it would be found that wherever the Romans adopted the river as a frontier. The lecture was illustrated by lantern slides.

Friday, July 3.

On this day the chief object of pilgrimage was Castleacre, with its earthworks, church and priory.

MILEHAM CASTLE.

The first pause of the Association was at the mound of Mileham Castle. It stands a little back from the road, overgrown with nettles and grass, which now wave impertinently in the Norman Keep. The Rev. A. Hunt, M.A., said the ruins were probably a Danish earthwork of the usual horseshoe design, with extended earthworks over some eleven acres of land. Much the same architecture is at Bedford and at Barrow Castle.

GREAT DUNHAM CHURCH.

After the Rev. Dr. Drummond had described Beeston Church, which belongs to the beginning of the fourteenth century, although its very beautiful hammer beam roof is of the fifteenth century, the party visited Great Dunham church, where the Rev. E. C. S. Upcher pointed out its important Saxon features. Probably the church was not built till after the Norman Conquest. The tower, quite definitely, has some very important Saxon features, among these the baluster shafts in the belfry windows. Mr. Upcher said there were originally two churches, the ruins of the other being on the opposite side of the lane passing the church.

SWAFFHAM CHURCH.

After lunch at Swaffham, the President of the Association took occasion to acknowledge the great help which Mr. E. A. Kent and Mr. Rudd had given to the Association during their stay in Norwich. A visit was paid to the church, where the double hammer beam roof with its 200 angels was described by Major Holmes (the churchwarden). There is an interesting history of the roof in that during Cromwell's reign a squad of his soldiers entered the church and, standing in the porch, fired at the angels carved on the roof. It is probable that if Cromwell's mother had not been buried at Swaffham, they would have attempted to do still more damage. Major Holmes also pointed out the vestry at the east end of the north aisle, which has a priest chamber above, with a library of 460 books.

CASTLEACRE.

From Swaffham the visitors went on to Castleacre, where they spent a considerable time in inspecting the earthworks, church and priory, each of which was described by Dr. Astley. The original earthworks are probably prehistoric, while the vallum and fosse of the outer bailey may have been built by the Romans. The keep was erected by Earl de Warenne, but there are now no remains of it, although the curtain wall still exists. The church is, broadly speaking, Perpendicular. The octagonal Perpendicular font has a beautifully carved tabernacle cover, and in the chancel there are some original stalls. The priory ruin is of a Cluniac house dedicated to St. Mary, St. Peter, and St. Paul, and was founded by William de Warenne before 1089. The west Norman front is the principal part remaining, and its south-west tower shows an interesting transition from round to pointed architecture. A Tudor gatehouse and priory buildings on the north-west side are still almost perfect, and other buildings can still be traced by their ruins. They are similar in arrangement to the normal Benedictine plan.

The President of the Association moved a resolution that the attention of the Earl of Leicester should be drawn to the wooden props supporting some parts of the ruins, which are not sufficiently adequate for this purpose, and that immediate steps should be taken to remedy this. The motion was seconded by Dr. Astley, and was passed unanimously.

EAST DEREHAM.

On arrival at East Dereham tea was first served at the Church House, after which the party visited the church where the grave of Cowper is in the north transept. The church has a particularly lovely seven sacrament font and a good example of a brass eagle lectern.

NORMAN FONTS IN WEST NORFOLK.

In the evening, at the Technical Institute, Mr. Edward M. Beloe, F.S.A., lectured on "Norman Fonts in West Norfolk," his remarks being illustrated by numerous slides of photographs taken by the lecturer. The Lord Mayor (Dr. G. S. Pope) and the Lady Mayoress were among the audience.

Mr. Beloe, at the outset, said that a great glut of church building took place in this country during the Norman period, but unfortunately so comparatively little remained. They must, however, be thankful that there was as much left as there was. The Norman fonts of West Norfolk formed a particularly fine group. They were to be found there in larger proportion than in any other part of Norfolk or of other counties, and they were in a very fine state of preservation. The font at Burnham Deepdale Church showed traces of the influence of Byzantine design, and that at Fincham a representation of Magi and the Nativity of Our Lord. The font at Sculthorpe Church also showed the Magi with the Virgin and Child. In the case of the font at Sherborne, the lecturer thought he could trace an unusual representation of the Temptation, where Eve was depicted seated in the tree and receiving the apple from the serpent. This representation differed from the stereotyped form such as was to be seen at Fincham, where our first parents were seen standing on either side of the tree. One act of Mediæval vandalism was visible at Ingoldisthorpe, where the square Norman font had been turned into an eight-sided one by the simple process of cutting off the four corners. Diagrams were shown of the intricate tracery and patterns characteristic of the work of these Norman fonts, and the photographs of many of the fonts themselves were greatly admired.

Saturday, July 4.

A last half-day was spent in Norwich prior to the members returning homewards, and the first place visited was Strangers Hall, which was described by Mr. Leonard G. Bolingbroke. It is a fifteenth-century merchant's house built over an earlier fourteenth-century dwelling. The central hall has a good king-post roof, a fine groined oriel window, and an oak staircase within a large bay window, dated 1627. The building has recently been generously presented by Mr. Bolingbroke to the city, and is now used as an historical museum.

After visiting St. Gregory's church and some old Norwich houses, the members adjourned to the Norwich Castle Museum, and after inspecting many of its treasures under the guidance of the curator they visited the Art Gallery, where they were met by the Lord Mayor, with the Lady Mayoress, who, in a few well-chosen words, bade farewell to the Association, and was cordially thanked by the President for all that he and the citizens and archaeologists of Norfolk had done to make the Congress a success.

Ranworth Church.

THE ARCHITECTURAL ASSOCIATION IN
WILTSHIRE

A Reunion of the Elder Members.

It has long been the ambition of those architects still remaining among the paladins associated with the earlier Victorian records of the A.A. annual excursions during the seventies and eighties to furnish a congenial opportunity for the revival of old and valued friendships. These famous outings which soon became popular among zealous young enthusiasts were started by Edmund Sharpe in 1870, at Lincoln. This reunion idea has now been successfully realised, the rendezvous being decided on at Devizes, where the gathering was hospitably entertained at the Bear Hotel, admirably adapted for such an occasion. Owing to the lapse of time the number inevitably could not be large, and some of the veteran excursionists were prevented from attending from various causes. However, the following members of the old brigade may be reckoned as representative of their fellows, viz., Messrs. H. D. Searles-Wood, for many seasons the hon. secretary; Andrew N. Prentice, Maurice B. Adams, W. Talbot Brown, of Wellingborough; C. E. Bateman, of Birmingham; Arthur W. Hennings, of Manchester (who organised the present proceedings), Alan C. Walker, from Tasmania; and N. P. Cart de Lafontaine.

The itinerary included some of the outstanding buildings and places of architectural interest included in the programme of the Bath excursion in 1887, when the late John Slater was President of the A.A. The facilities afforded by automobiles nowadays presented less difficulty in arranging a comprehensive topographical progression, although owing to the informal character of the proceedings anticipatory provisions, such as insuring permission for access, were obviously impossible, especially in visiting mansions like the beautiful early sixteenth-century house at Littlecote Park Manor, not far from Hungerford, one of the most romantic historic places in Wiltshire. The estate is still owned by the Pophams descended from Sir John Popham, and prior to him was in the possession of the Darrels up to the "great Littlecote tragedy" associated with the days of Queen Elizabeth. The contents of this mansion include splendid furniture and paintings, and the park provides its own private golf course. The red brick façade of the frontispiece presents an unaltered masterpiece of design mellowed by time, but the garden front has been much added to and suggests a series of houses with many gables periodically built.

The first visit of the week was devoted to the noble Collegiate Church at Edington, last seen by the excursionists 37 years ago, when Mr. C. E. Ponting, the architect of its restoration, was engaged upon his excellent work of repair, which has preserved the fabric without interfering with its architectural charms. The church at Edington is too well-known to need description in this necessarily brief epitome, but nothing in Wiltshire competes with this complete and symmetrical uniform example of the Transition period from the Decorated style to the Perpendicular, and it stands unaltered since its erection between 1352-1361 by a designer only second to William of Wykeham.

Not far away, under the White Horse on Bratton Down, the visitors saw the admirable and spacious little cruciform church of early fifteenth-century date, with its charming central tower and clerestoried nave, quite small as a whole but handled in a large way so admirably as to be justly reckoned unique in this country as a really fine work, when the Perpendicular time was at its best. Breadth is shown compatible with a restricted size, and good proportions form the dominating merit of happy art by this instance of the architecture of the fifteenth century, standing well-placed overlooking the valley.

from whence it is approached by 300 steps. Steeple Aston to the south of the Keovil is more familiar in a general sense on account of its once important Staple Market of the "clothiers." Its treasure in chief now is the conspicuous church with a magnificent tower which had a spire 93 feet high injured by lightning in 1670 and never repaired. The nave is roofed with panelled oak, but the aisles and chapels are vaulted and richly sculptured with canopied niches. Seen from the village street the building presents a picture not easily forgotten.

Bromham Church commenced the second day's programme. Less known to most people, it possesses the exquisite Beauchamp Chapel founded by Lord St. Armand as a charity in honour of Our Lady. It is an exact counterpart of the South Chapel in St. John's Devises by the same founder, and deserves the just description of being a truly marvellous example of late Gothic, exquisite in design inside and out, parapeted and panelled and most profusely ornamented, enriched and adorned, while the noble carved roof still retains its ancient gorgeous decoration with gold and colour. Nothing of its quality seen during the week surpassed the beauty of this late addition to the otherwise quite interesting church, which is partly Norman. Lacock Abbey and Corsham occupied the rest of the day. Both were visited in 1887, and since then the former has been partly renovated by Mr. Harold Brakspear, A.R.I.B.A., who with knowledge and no little skill has added new windows to the vaulted Refectory and other ancient apartments of the Nunnery; also he has traced out the extent and remains of their big church, besides repairing the traceried work in the openings of the famous cloisters. Lacock village is perhaps the most remarkable in Wiltshire with its old houses, Tithe Barn and church dedicated to St. Cyriac. The sketcher could scarcely find a greater wealth of subjects anywhere, though so famous a spot here needs little description. The chief subject of notice in the church is the chantry chapel on the north. The Tudor additions to the abbey stable quad are specially attractive to the lover of the picturesque. Of Corsham we may say but little because its Court House, old almshouses and fine church are so well-known. The visitors recalled their previous visit and noticed several appropriate additions to the last-named building. It was badly over restored previously, but Geo. E. Street did his work well and built the tower and spire after the traditional lines of Wiltshire buildings which he wisely adapted. Bishop Canning's church was seen on the way over the Downs to Avebury. It stands on the royal estate associated with the ancient Bishops of Ramsbury. The building is cruciform, of early English character, with clerestory and roof of Perpendicular date. The windows in the west wall of the nave and in the transepts are of their date unequalled in the country, while the general outline and scale of the Church make it quite Cathedral-like in effect. Avebury church is less important but it interests more, in spite of the early 19th century restorations. The manor house adjacent is Elizabethan in origin, the quite queer little village, with some of the cottages opening into the graveyard, made delightful combinations, not forgetting the thall-covered path on the great garden stone wall, and the pigeon round house in the farmyard on the north. The parish, for over 100 years, was without a resident priest but is now well cared for. The rood screen much enhances the interior of the sanctuary. Mr. Fonting did his best with refurbishing the chancel, rebuilt in 1879. The upkeep of Avebury House and its gardens add greatly to the beauty of the place. At Marlborough College the visitors were fortunate in obtaining the hospitable assistance of the well-known musical director, Dr. F. W. Ivimey, who conducted them over the new Memorial

Hall erected from the designs of Mr. William G. Newton, F.R.I.B.A., whose chosen competitor drawings of this building were familiar in the recent Royal Academy exhibitions. The acoustic capabilities of the structure were carefully tested by the accomplished cicerone who rendered a selection for this purpose on an orchestral grand piano and spoke from various positions to the visitors standing at the far distance on the uppermost encircling aisle. Next the segment of the Hall, where the wall is draped with folded hangings. The curtains to the series of windows were also drawn throughout, further to exemplify the capacity and control of the sound. The colour decoration in tones of yellow quietly conceived, is very effective and set off by gilt sconces and the dark blue of the curtains. The electric lighting adds materially to the colour result. The music rooms below, also the practice rooms flanking the stage, were visited and the raft construction explained. The splendid chapel at Marlborough College, designed by G. F. Bodley, R.A., was seen and greatly admired, also the great improvement carried out by the rearrangement of the forecourt at the base of the chapel steps and the front of the colonnaded frontispiece of the New Hall. The old parts of Marlborough College, the common rooms, &c., were most kindly shown, also the grounds at the rear as well as the duelling ground hidden among the shrubs. The recent extensions of the College by Sir Aston Webb, on the other side of the high road, with the bold connecting arched bridge of one span, make an admirable feature of good scale and properly devoid of superfluous ornaments. Sir Aston's work makes a fine foil to Bodley's Gothic chapel close by.

The three old churches called at on the return journey to Devizes, viz., Alton Barnes, Alton Priors and All Cannings, proved of differing interest, but demand no special comment here. West Lavington, Westbury and Trowbridge filled the available time owing to the wet on the following outing. The first-named is "a delicious village," and Bishops Lavington also; one time belonged to the Bishops of Sarum. The purpose of the visit was to see the commodious and well-located old house at West Lavington, now occupied by Mr. Thomas Holloway, the well-known contractor. The party was shown over the premises and garden by Mrs. Henry Holloway, much to the visitor's satisfaction. Erlestoke, near by, is full of typical cottages traditional to the county. Westbury has developed since the railway came, but is not enhanced by the change architecturally. All Saints', amid chestnut trees, is worthy of so important a parish, and may be described as a spacious church of cruciform plan with a fine central Perpendicular tower, the whole fabric being on a Norman foundation and having fine original roofs, the clerestory being later than the nave. By roundabout way through a pleasant country the day's visit ended at "the wide-awake little town of Trowbridge," the third town in Wiltshire, only one strip by Swindon and Salisbury. The church "lightsun and fair," was practically rebuilt in 1845; notwithstanding this, it has its points of interest, dating as it does from 1475. The chief attraction is the lofty stone spire said to date from the time of old John of Gaunt. H. George Crabbe the poet was parson from 1814 to 1832, where he wrote "Tales from the Hall," and was buried in the chancel. The drenching rain persisting precluded further enterprise, and so Devizes afforded the excursion a welcome.

Littlecote was reached next day by way of Hungerford after passing through Savern Forest, partly on the road. The party were impressed very much by the church at Hungerford, where it is proposed to erect three screens and parvise, one to form a choir apse. The quasi-apse in nondescript Gothic is ungainly, with the east window in the curve. I thought the war memorial triptych in the north aisle, in painted wood, with well-carved figures and crucifix, was quite excellent, and to prevent removal at any time this structure should be attached to the fabric permanently. Ramsbury

ARCHITECTURAL SCHOOLS

LIVERPOOL SCHOOL OF ARCHITECTURE.

WE have received a copy of the prospectus of the University of Liverpool School of Architecture for the session 1925-26, which includes an appendix descriptive of the Department of Civic Design. The prospectus sets forth all necessary particulars relating to the courses of study provided, and is illustrated by some excellent specimens of students' work. The work of the school is directed by Professor C. H. Reilly, O.B.E., M.A. Cantab., F.R.I.B.A. (Associate Professor of Architecture), L. B. Budden, M.A., A.R.I.B.A., with Professor L. P. Abercrombie, M.A., A.R.I.B.A. in charge of the Department of Civic Design.

The Liverpool School, founded in 1894, offers courses which are designed to provide a full professional education at a University standard for all who intend to practise as architects and who wish to acquire their training in an atmosphere of liberal studies, side by side with the students of other professions. To meet the varied needs of architectural practice as they have now developed, the School offers courses of study leading, if preceded by matriculation, to the Degree of Bachelor of Architecture (B.Arch.) or, if not so preceded, qualifying for the Diploma in Architecture. These courses, which are identical both for the Degree and for the Diploma, extend for five years and are of three kinds—the Pass course; the course with Honours or Distinction in Architectural Design; and the course with Honours or Distinction in Architectural Construction. The curriculum of the first three years is common to all three courses, whilst that of the fourth and fifth years in the case of students taking honours or Distinction goes beyond the pass type. Each of the courses is devised so as to equip the student with the most efficient training possible for the vocational work he proposes to do. The lecture courses are arranged to run parallel with the work done under instruction in the studios.

Under the regulations governing the courses of study students are required to spend six months of their fourth and fifth years respectively in some approved form of practical work, usually in an architect's office where they can earn a salary. For some time past the School has established connections with certain of the best known architectural offices in New York. In consequence, students during the summer term and long-vacation of their fourth year of study have the opportunity of securing temporary positions as paid assistants in these offices at rates of pay which, with care, cover their passages either way. The School was the first to formulate and to present Degree and Diploma courses of a full professional kind to the Board of Architectural Education of the R.I.B.A., and was the first of the six schools now recognised by the Institute to secure for its graduates exemption from all subjects but one of the Institute's Final Examination.

The Department of Civic Design is intimately connected with the School of Architecture, and the students of both pursue their studies together in the same building. This arrangement tends to exercise a beneficial influence on both; and indicates the belief that artistic design should be concerned with every aspect of town planning. The study of social conditions and the preliminary data upon which development should be based is also encouraged by connection with the School of Social Science and the Regional Survey of the Geographical Department. The University grants a Certificate and a Diploma in Civic Design. The courses leading to a certificate are especially arranged to deal with the basic principles of town planning, and will treat of problems involved in city remodelling, industrial development, traffic, and suburban extension. During the course students will attend lectures on civic development, engineering, law, and landscape design. Studio work will include the plotting of new lines of communication, the sub-division of areas on plans of existing towns, and will deal

exhaustively with the many detailed problems involved in planning the sites for housing schemes. The course extends over two Sessions of two terms each.

CARDIFF TECHNICAL COLLEGE.

Department of Architecture and Civic Design.

At the Technical College, Cardiff, ten scholarships covering tuition fees and maintenance grants of £40 per annum for three years are offered for competition annually. As candidates for entry to the Department of Architecture and Civic Design are eligible to compete for these scholarships, they are of considerable interest to those who contemplate entering the architectural profession. The scholarship examination is a competitive one, and is of about the same standard as matriculation. In the case of candidates for the School of Architecture the subjects of this examination are:—(1) English; (2) mathematics—two papers (a) algebra and arithmetic, (b) geometry and mensuration; (3) a modern language (French, German or Welsh); (4) physics with mechanics, or chemistry, or higher mathematics; (5) history or geography. Candidates must further satisfy the head of the Department of Architecture as to their ability in elementary drawing.

The Department has now been at work for rather more than five years under the charge of Mr. W. S. Purchon, M.A., A.R.I.B.A., the lecturer in Architecture being Mr. R. H. Winder, M.A., A.R.I.B.A., and the assistant lecturer, Mr. Lewis John, M.A., A.R.I.B.A. The following local architects assist in the work of the Advanced Course as Honorary Lecturers:—Messrs. Percy Thomas, F.R.I.B.A., Ivor Jones, A.R.I.B.A., T. Alwyn Lloyd, F.R.I.B.A., H. Teather, F.R.I.B.A., A. L. Thomas, F.S.I., C. S. Thomas, F.R.I.B.A., and J. H. Jones, F.R.I.B.A., and Mr. T. Pierson Frank, M.Inst.C.E., F.S.I., City Engineer, Cardiff. Students in the Department also attend courses in the Departments of Engineering, Technical Chemistry, Mathematics, and the School of Art, all of which are housed in the same building.

The Cardiff school is "recognised" by the Royal Institute of British Architects, which grants exemption from its Intermediate Examination to students who pass successfully through the three years' full-time day course leading to the certificate. In addition to this course the Department provides a Diploma Course consisting of two Sessions, the former of these being of six months' duration only, the intervening six months being spent in architects' offices. There is also an Evening Atelier for architects' assistants who cannot attend the day courses. The Department is in close touch with the South Wales Institute of Architects, representatives of this body being on the Advisory Committee of the school, and students of the school are eligible for the prizes awarded by the Institute. In addition to these awards there are a number of school prizes presented in the main by local architects. The External Examiner for the past session was Professor A. C. Dickie, M.A., F.S.A., A.R.I.B.A.

The school year commences on Tuesday, October 6, but intending students should apply at an early date for particulars of the courses of instruction and of the entrance and scholarship examinations. Application forms for the latter must be completed and submitted by September 14.

New Housing Scheme at Kensington.

Kensington Borough Council has agreed to a scheme by which it will pay to the L.C.C. £4 10s. per house for 40 years on 100 houses to be erected on the Old Oak Common Housing Estate, for families to be selected by the Kensington Council. For this annual contribution of £450 it is estimated that the Council will secure housing accommodation for 500 persons.

after Littlecote, has a church of fewer actions, but the square, handsome brick-t Manor House, a mile beyond the village, in noble park in which the river Kennet feeds lake, is an admirable seventeenth-century mansion replete with refined Renaissance stone rails attributed to John Webb, pupil of Inigo Jones, and his work is thoroughly English, with gates of the same date. The extraordinary wings of Mildenhall, carried out in wood about 16, at great expense, including a west gallery, so elaborated that it seems cruel to say how difficult it would be to conceive anything worse than in plasterer's Gothic. They are so curious that the work has an interest and shows the style of the period when it was done.

The concluding day began at Potterne, a delightful village with a beautiful church on the east and having an unsurpassed approach, with hedges flanked by trimmed shrubs. The building is excellent Early English, and "might have been designed by Elias of Dereham," as Mr. Howard Hutton says. "Porch House" is the chief of attraction in the village; it is suggested was once known as "Pack Horse Inn." This half-timbered building belonged to George Richmond, R.A., who restored it. The interior is replete with its ancient roofs and collection of appropriate furniture, and it has a capital garden at the rear. There is not much to say about Chippenham, because so many know the merits of its great church, the tower of which was rebuilt in 1442; but in 1633 the structure was new and was reconstructed, the steeple rising 15 ft. lower than its predecessor. There is much good glass in the Lady Chapel and church generally, but the best of all is the war memorial window of four archangels in the chancel by the late Christopher Whall, a work of merit, even if the dark blue glass in the very masks the stone work excessively. The church by Wood of Bath, built in 1779, distinguished piece of design and in its way. It is too much like a private chapel, of course, for parochial needs, but architecturally worth seeing at Hardenhuish. Yatton Key has a small manor house of the seventeenth century, and Biddstone village possesses many stone houses set out regardless of continuity of space. The Manor House beyond is a particularly refined and singularly unpretentious building in scale throughout. Castle Combe, north-west Yatton, in the valley of the By Brook, is the loveliest village in Wiltshire, and in way is as unique as Clovelly. The Market Cross building is set off by its surroundings and church, in itself not distinguished, has a sculptured arch to the chancel the like of which we do not recall. The church at Melksham furnished the last stage of the excursion, the note of its having wide windows over the piers in the clerestory has to be added in conclusion because that arrangement is very common and structurally not preferable.

"Harlequinade."

Lord Eustace Percy, at the A.A. prize-giving recently, remarked on the lack of a humorous touch to architecture. It is evident from this that he had not read *Harlequinade*, the A.A. Architects' magazine, of which the last two numbers are before us. Its bright little articles and poems make excellent reading and the sketches with which it is besprinkled are very nicely done. It is rumoured that *Harlequinade* is being discontinued for financial reasons, and that these are probably the last issues. It would be a pity for a magazine to be eclipsed through lack of effort. The price is half-a-crown.

Death of Mr. Arnold W. Brunner

We regret to announce the death of Mr. Arnold W. Brunner, the distinguished American architect. Mr. Brunner always took a keen interest in the American Institute of Architects, and was at one time President of the New York Chapter. He was also a past President of the Architectural League of New York, as well as of the Fine Arts Federation. A great part of Mr. Brunner's practice was confined to governmental and institutional work.

ARCHITECTS' & BUILDERS' INQUIRY BUREAU

We are glad to give questions and answers, but cannot accept responsibility for contributed replies, especially on legal matters.

May we appeal to our correspondents to submit their queries on paper of a size easily filed, and written as legibly as possible, or, better still, in typewriting?—*Ed.*

Tiling Phenomenon.

REPLY TO "JERSEY."

SIR,—The Bridgewater, in common with other types of single lapped tile, depends very largely upon its own weight to resist the pressure of a strong gale, and the flatter the pitch, the more does the dead weight of the individual tile operate against the more or less horizontal pressure of the wind, and the less the surface presented normally thereto. This is no doubt the solution of the puzzle. Another strange thing about this form of tiling, which I have myself observed, is that where tiles become blown off, it is generally those on the leeward side that go, the wind passing through the interstices between the tiles on the windward side and directly lifting those on the side that would naturally be considered the more sheltered. This points strongly in favour of well torching the undersides of this form of roofing.

PRACTICE.

Increase in Price of Building.

[REPLY TO "LONDON," AUGUST 7.]

SIR,—The spirit of the R.I.B.A. contract, or any other for that matter, is one of reasonable compromise. If the builder can prove satisfactorily that the item in question is a dead loss, it would be far better for the architect to agree to a reasonable addition on cost. If it were enforced, as suggested, by another contractor doing the job, the situation seems wrong, and one hardly knows where it would end.

G. W. HARRIS.

SIR,—A contractor who has undertaken a contract upon bills of quantities in the usual contract form, and has submitted his priced schedule in the usual way, has no right to charge any but the same schedule rates for variation work, until he has completed his contract. In deciding whether certain extra work can be ruled as merely a variation on the contract, or whether such work is so extensive as to constitute a subject of new contract, it is only possible to judge on the merits of the case. For instance, if the contract for a hospital was increased by a complete additional ward, it would not be possible to force the contractor to undertake this additional work on schedule prices without his consent, and he could claim a new contract; but if a contract included, say, a number of pantry cupboards, and one additional was ordered, such a matter would be purely a variation on the contract, and the contractor could not claim any higher than the schedule rates simply because the originals were priced at a rate that did not pay. Where to draw the exact line is difficult to define, and matters may be so much in the balance that either party might go to law with some confidence. This is, however, always to be avoided where possible, and the architect can often view the matter in a properly judicial manner and determine whether a great hardship may be imposed upon the contractor by rigidly adhering to the schedule. A little advice to both parties may very well settle the matter with satisfaction.

"JUSTICE."

Parquetry Warping.

[REPLY TO "PERFECTO," AUGUST 7.]

SIR,—Where the warping is of old standing and the heat has had the chance to carry its results to their limit, it is quite safe to plane off the parquetry to a new surface which has every likelihood of standing. To avoid this trouble in new work, the heating pipes under should be well wrapped or coated with an

insulating material, and the space below the floor well ventilated. If the floor is then well and truly laid no trouble as to warping need be anticipated.

"EQUABLE."

SIR,—The heating pipe trenches should be so designed that the parquetry coming on top of pipes should be at least three-quarters to 1 in. thick, and intersect into the other part, which is usually only $\frac{1}{4}$ in. thick; furthermore, it should be rebated if intended to be part of the whole floor.

G. W. HARRIS.

Well under House.

SIR,—Under a house which stands on a sand bank in clay soil there is a well for drinking water and washing purposes; rain water is collected from the roof. Is there any means of finding out whether the well would supply sufficient water for washing and cooking in all weathers? The rain water is soon used up in dry weather, but the drinking water never runs dry.

"WATER."

Shuttering.

SIR,—What is the best material to put on boards which are to be used for shuttering for concrete?

R. M. P.

A Girder Question.

SIR,—It is intended to place a box girder, comprising three 12 in. by 5 in. girders plated top and bottom, into an existing 18 in. wall some 13 ft. from floor line, and removing the wall underneath. I believe there is a way of box needling on the present wall instead of using needles and a long strut inside and outside, and should be obliged if any reader could give a rough sketch.

F. G. J.

Preserving Post Ends.

SIRS,—What is the best method of preserving the ends of posts which have to be sunk in the ground? Would crude carbolic acid be suitable for this purpose, either alone or used mixed with creosote or tar?

T. BARTON.

Composition of Bronze.

[REPLY TO "ANTIQUARY," AUGUST 7.]

SIR,—Old bronze usually contained a small proportion of lead which gave a less even quality, though the material was less brittle and better suited to the finish of those parts that were lost in the process of casting. In some cases silver and iron were mixed in the alloy for special purposes of colour.

"BRONZE."

Velocity of Flow in Drains.

[REPLY TO "DESIGNER," AUGUST 7.]

SIR,—Eytelwein's formula will give the information required by your correspondent.

V equals 55 times the square root of H times 2F, where

V is the velocity in feet per minute,

H the hydraulic mean depth in feet,

F the fall in feet per mile.

"FORMULA."

Cleaning Porcelain Enamel Baths.

[REPLIES TO R.P.B., AUGUST 14.]

SIR,—I always advise the following, and find it very satisfactory. Take about a couple of tablespoonfuls of paraffin and a rag and well rub the bath round. Wash off with warm soap and water.

E. B.

A Mortgage Question.

SIR,—A has a house (in which he resides) also several cottages, all tenanted, and so land. He obtains a mortgage on the whole lot from a Building Society, and after a time is unable to meet the capital and interest charges. The Society offer the whole in various lots for sale by auction, for which no bids forthcoming; then they proceed to collect rents from all others except A. They write saying they want him to get out of the house as they are going to offer it for sale with vacant possession. Can they force A to give up house as tenant if he is not in a position to purchase it, he having offered to pay the rent? Does the Rent or Mortgage Act offer no protection in a case of this sort? If A wished to take this lot over again, is there any limited number of years in which he must do so?

"MERSEY."

[From the information given it would appear that the Building Society is in the position of the mortgagee in possession of the whole of the property. It is not made clear why the Building Society has collected rents from the tenants of the property except A, since it was entitled to collect from all, including A. Nevertheless A is in the same position as the other tenants. He has at all times been willing to pay rent, and at the present moment is willing to pay rent and provided the "standing rent" is within the limits of the Rent Restriction and Mortgage Acts, he is protected by those Acts just as much as the other tenants are; and the Building Society cannot treat A in respect of his house differently from the other tenants in respect of their cottages, i.e. it is not entitled to sell A's house with possession of the cottages. As to the second part of the query, A not having complied with the terms of the mortgage deed is not, nor at any time will be, in the position to take the lot over again; except by arrangement on terms he may be able to make with the Building Society. Nor is there any limited number of years in which he is able to do so. He forfeited his rights under the mortgage deed with the Building Society when he failed to comply with its terms.]

Imports of Bricks and Tiles.

SIR,—Will you please give the imports into the United Kingdom of bricks and tiles during the years 1920, 1921, 1922 and 1923, also imports of the same materials for the first months (or such months as may be available) of the current year?

W. G. E.

[The figures are as follows:—

	1920.	1921.	1922.	1923.
Bricks	37,000	3,920,000	535,000	7,372.
Tiles (all except floor tiles and glazed and hearth tiles), in tons—				
	1920.	1921.	1922.	1923.
	1,322	20,614	11,567	16,554

For the seven months of this year ending July, the imports of bricks were 82,829, and 51,341 tons of tile.—*Ed.*

Hard Tennis Court.

SIR,—I shall be obliged if you will give some information on the construction of a hard tennis court—a green surfaced one for reference—or tell me of a book dealing with the subject.

F. P. MERRITT.

Rise and Go of Stairs.

[REPLY TO "PITCH," AUGUST 14.]

SIR,—The average man's pace is a 23 in., and the exertion expended in moving vertically is double that of progressing horizontally. In an "easy" staircase each will approximate to a 23 in. pace. The rise will be "normal exertion," and if deducted from 23 in. will leave double the rise, since rise may be taken as twice "normal exertion."

S. M.

THE BUILDING TRADE.

THE DOMESTIC GRATE

By T. P. BENNETT, F.R.I.B.A., Hon.F.I.O.B.

THE Fuel Research Board has issued an additional Technical Paper on "The Domestic Grate,"* containing details of experimental investigation conducted by Miss Margaret Fishenden, D.Sc., F.Inst.P., whose work in this connection is well known. The domestic grate is a matter of considerable interest to the whole community, since it is evident that it offers the most economical method of heating rooms in small houses, and combines with this economy a cheerfulness and attraction which are universally admitted.

The heating of rooms is one of the prime necessities of living, at any rate under civilised conditions. In the Middle Ages wood was universally employed and remained the principal fuel of the country until the nineteenth century. It is interesting to note that the total output of coal in this country was 10,000,000 tons in 1800 and 215,000,000 tons in 1900. This vast increase coincided with universal coal burning in small grates, and the Victorian grate, familiar to all, was evolved. A considerable revision of the Victorian grate has been experienced during the last twenty-five years, the outstanding change being the use of fire-brick for forming the heating surface in place of the old cast-iron basket and backing. It is the principal merit of the coal fire that heat is obtained from it by direct radiation, radiant heat having proved to be infinitely more pleasant to the human body than convected heat which is received from the radiator. If the coal fire could be made very much more efficient than it is at present, a great boon would be conferred upon the less wealthy portion of the community, and there is unquestionably still room for a very large amount of experimental work in this direction.

Two main paths of inquiry have been investigated: one deals with a fire which is as vertical as possible, and the other, that of a deep fire, a more or less horizontal fire. Miss Fishenden's work proves that, broadly speaking, bars do not reduce seriously the amount of radiation from a fire, and this is brought about by their ability to hold the fire in a vertical position and enable it to present its maximum surface to the room. In the best modern fires, 15 per cent. to 20 per cent. of radiation efficiency is secured, but this obviously leaves room for substantial improvement. It is a question whether a grate will ever be evolved which will enable the user to get complete combustion, and the whole of the advantages of combustion in useful heat in his room. The experiments which have recently been conducted show that the very large quantity of fuel which is capable of being moved across a room by the ordinary coal fire seriously affects the temperature of the room and causes inequality of draught in the fire, as well as seriously retarding the heating-up of the surfaces of the walls and furniture. The two principal factors in efficient coal-fire heating, therefore, are the design of the grate and regulation of the draught. The principal part of Miss Fishenden's present report is concerned with experiments in the reduction of the depth of the grate from front to back, in the introduction of a sloping back, and of sloping sides to a standard grate. It is admitted that the result of these investigations is to prove that a grate with a fair amount of bottom area and with a sloping back gives the whole the best results. If the bars are used, a relatively shallow grate is possible. It does not appear to be a very striking conclusion: in a sense it merely reflects the

statements made by fire-grate manufacturers for the last ten years. It may seem too much to expect the scientist to be able to evolve a perfect article from the consideration of abstract conditions, but this is, after all, the fundamental purpose of scientific study. If it were possible to give a summary of scientific, as opposed to empirical, methods it would probably be said that science substitutes logical deduction for a process of trial and error, and it would, therefore, seem not unreasonable to ask the scientist to consider the fundamental problem of the domestic grate as a heating unit placed in the centre of one side of an apartment, to use the smallest possible quantity of soft coal, and to be so designed that it would be capable of completely consuming this coal and giving 80 per cent. or 90 per cent. of the heat into the room. Progress of grate design has been a matter of evolution: the architect and the public are now asking the scientist to proceed to a method of revolution, and the scientist should be capable of obtaining an achievement which a few years ago would have been impossible.

Miss Fishenden states that 1 lb. of good quality coal in an ordinary open grate is equivalent to a temperature of nearly 200 degrees Fahrenheit in 1,000 cu. ft. of air. In other words, if a room were perfectly insulated, two complete changes of air could be provided by a consumption of 2 lb. of coal an hour for every 1,000 cu. ft. of room space, and this would suffice to maintain the air at a temperature of 60 degrees Fahrenheit with an entering air temperature of 40 degrees Fahrenheit. Open coal fires, as ordinarily installed, frequently induce from five to ten complete changes of air per hour in rooms of moderate size, which would reduce the air temperature to some 48-44 degrees Fahrenheit. Unquestionably draught control is one of the principal elements of efficient grate design, and it would seem that the best method of controlling the air passing through the burning fuel has yet to be found. When found, it must obviously be capable of automatic adjustment by comparatively unintelligent operators, such as residents in houses, or maids.

It is a common cause of complaint against the coal fire that so large a proportion of the heat vanishes up the chimney, and it would seem that Miss Fishenden is reconciled to this excessive waste. She states that "it is doubtful whether the radiation efficiency of open coal fires against a wall can easily be increased beyond some 30 per cent. or 35 per cent. of the theoretical energy of combustion." It may be admitted that an increase beyond these figures is a matter of difficulty, but it should be the object of a Government Research Department to overcome these difficulties and to lay down a theoretical basis which is capable of producing a highly efficient article. The gas fire and the electric stove rely entirely upon their efficiency for their use. The coal fire hitherto has been able to employ cheap fuel, and the urgent need for efficiency has therefore been much smaller. Human nature seems to demand some great incentive before it can produce articles which are advantageous for it, and it may be that the increasing cost of coal will do more to produce efficient grates than scientific investigation or householders' complaints. It might even be possible that the coal industry will make a combined effort to produce a grate capable of emitting this valuable radiant heat at a tithe of the cost of its competitors, gas and electricity. We may finally borrow from the Fuel Research Board's Technical Paper a summary of the conditions

which must be fulfilled by an efficient coal fire. They are as follow:—(1) The use of correctly designed grates, properly fitted; (2) the provision of adequate draught control so that not only may the fire be rapidly adjusted to meet varying requirements, but also the air-flow through the room may be reduced to the minimum consistent with the demands of hygiene and comfort; and (3) efficient insulation of the room.

The problem presented still awaits a solution which would be of universal advantage.

BOND BETWEEN CONCRETE AND STEEL

IN describing the results of his investigations into the relation between the bond between concrete and steel and the factors which govern the compressive strength of concrete, Professor Duff A. Abrams gave the following as his conclusions to a recent meeting of the American Society for Testing Materials. The tests were made by applying a pull on one end of 1 in. plain round steel bars embedded axially in 8 in. by 8 in. cylinders. The concrete specimens were made from a wide range in size and grading of aggregates, quantity of water, and cement, and were tested at ages from seven days to one year.

(1) A steel bar embedded in concrete offers considerable resistance to a pull-out load. Slipping of the bar begins at a bond stress of about 10 to 15 per cent. of the compressive strength of the concrete, but considerable additional load is taken before the ultimate bond resistance is reached. For pull-out tests of the type used, 0.0005 in. end slip of bar occurred at 55 to 60 per cent. of the maximum bond; for mixtures lower than 1:1 the maximum bond was about 24 per cent. of the compressive strength of the concrete and came at an end slip of about 0.01 in.

(2) Bond and compressive strength increased with age of the concrete from seven days to one year. For 1:5 concrete of water-ratio 0.88, the bond at one year was 134 per cent. of the 28-day value, and compressive strength 148 per cent.

(3) Bond responded to changes in water-ratio of the concrete in much the same way as compressive strength; increase in water-ratio due to use of wetter concrete, less cement, or an excess of fine aggregate, resulted in material reductions in both bond and compressive strength. Other tests have shown that the same statement applies to the impermeability, resistance to wear, and resistance to destructive agencies such as weather, sea and sulphate waters, &c.

(4) For mixtures richer than 1:1 the bond fell off, probably due to the greater volume changes during hardening which is characteristic of such mixtures.

(5) The use of 4 per cent. of the 28-day compressive strength of concrete as the working stress in bond for plain bars, as specified by the Joint Committee, is justified; this gives a factor of safety of about 2½ to 3 against first slip.

(6) The use of crude oil to replace mixing water, in general, caused a reduction in both bond and compressive strength of concrete. Five per cent. of oil reduced the bond at 28 days about 20 per cent.; at one year, about 6 per cent.; compressive strength at 28 days and one year was reduced about 3 per cent.

(7) Replacing cement with hydrated lime decreased the compressive strength and bond about 1.2 per cent. for each 1 per cent. of hydrated lime in terms of volume of cement, or about 2.0 per cent. for each 1 per cent. by weight.

*THE DOMESTIC GRATE, by Margaret White Fishenden, D.Sc., F.Inst.P. H.M. Stationery Office. 9d. net.

THE SMALL DWELLINGS ACQUISITION ACT, 1899

It is, perhaps, a matter for regret that the Small Dwellings Acquisition Act, 1899, which for some 20 years attracted so little attention, and which is not referred to in the older text books on housing, should only have been amended "by reference" in the various Housing Acts and still does not appear in the Housing Act, 1925, which is a consolidating Statute. This little Act has thus escaped attention to a great extent and little use was made of it through the pressing housing period from 1914 onward. Its provisions as amended are still somewhat difficult to refer to, so we propose to give a short summary of such as are of primary importance at the present time.

Originally the Small Dwellings Acquisition Act only applied to enable local authorities "to advance money to a resident in any house within the area for enabling him to acquire the ownership of that house," and such advances could only be made "where in the opinion of the local authority the market value of the house" did not exceed £400. The Housing Act, 1919, by section 49 raised the amount of the market value to a sum not exceeding £800, but by the Housing Act, 1923, section 22, para. (b) the sum was again raised and now is £1,200. But an even more important extension of the Small Dwellings Act was made by the Housing Act, 1923, in section 22 paragraph (a) which provides, "The advance under that Act may be made to a person intending to construct a house, and in such case the limitation in that Act requiring that the person to whom the advance is made must be resident in the house, shall be construed as requiring that the person should be a person intending to reside in the house when constructed."

Paragraph (c) also provides that "The statutory condition requiring the proprietor of a house in respect of which an advance has been made to reside in the house shall have effect for a period of three years from the date when the advance is made, or from the date on which the house is completed, whichever is the later, but no longer, and compliance with this condition may at any time be dispensed with by the local authority."

The maximum market value of the house being now £1,200, the next question of interest to the applicant will be what advance can he expect in respect of his particular property?

Section 22 paragraph (d) of the Housing Act, 1923, deals with this point. It provides: "The market value of the ownership of any house in respect of which an advance is to be made under that Act" (the Small Dwellings Act) "shall be ascertained by means of a valuation duly made on behalf of the local authority, and the amount of any such advance shall not exceed 90 per cent. of the market value as so ascertained," and in the case of houses which it is proposed to construct, paragraph (e) provides, "Where an advance is made in respect of a house in course of construction, the advance may be made by instalments from time to time as the building of the house progresses, so that the total advance does not at any time exceed 50 per cent. of the value of the work done up to that time on the construction of the house, including the value of the interest of the person to whom the advance is made in the site thereof." These latter words are very important to persons of limited means who desire to purchase a site.

The above are practically all the amendments introduced into the Small Dwellings Act by the Housing Act, 1923, except as regards Scotland, and as regards the final paragraph in section 22, (f), which provides that the acceptance of an advance is not to disqualify the recipient from being elected as or being a member of the local authority by whom the advance is made, or any committee of such local authority.

The next point of interest will be the terms

on which the advance can be obtained and the period over which it can extend.

By subsection (3) of section 1 of the Small Dwellings Act it was provided that the interest should be "at such rate as may be agreed upon, not exceeding ten shillings above the rate at which the local authority could borrow the money for the advance," . . . but this subsection was repealed by section 5 of the Housing Act, 1921, which provides that "the rate of interest on advances under section 1 of the Small Dwellings Acquisition Act, 1899 . . . shall as regards advances made . . . after the commencement of this Act be such rate as the Minister may, with the approval of the Treasury, from time to time by order fix, and different rates of interest may be fixed for different purposes and in different cases."

As regards the period for repayment, Section 1 subsection (2) of the Small Dwellings Act provides, "Every such advance shall be repaid with interest within such period not exceeding 30 years from the date of the advance as may be agreed upon." Subsection (4) of section 1 provides, "The repayment may be made either by equal instalments of principal or by an annuity of principal and interest combined, and all payments on account of interest and principal shall be made either weekly or at any periods not exceeding a half-year according as may be agreed," and subsection (5) contains provisions enabling the proprietor of a house after one month's written notice to pay off the whole or any part of the advance.

Under section 2, before making an advance, the local authority has to be satisfied (a) that the applicant is a resident or intending resident in the house and is not already the proprietor within the meaning of the Act of a house to which the statutory conditions apply; (b) that the value of the ownership is sufficient; (c) that the title of the ownership is one which an ordinary mortgagee would be willing to accept; (d) that the house is in good sanitary condition and good repair; and (e) that the repayment of the advance is secured by an instrument vesting the ownership (including any interest already held by the purchaser) in the local authority, subject to the right of redemption by the applicant, but such instrument shall not contain anything inconsistent with the provisions of the Act.

By section 3, until the advance is fully paid, the house is held subject to certain conditions (a) the sums due for principal and interest must be punctually paid; (b) the proprietor shall reside in the house; (c) it must be insured against fire; (d) must be kept in good sanitary condition and repair; (e) must not be used for the sale of intoxicating liquors; and (f) power is given to the local authority to enter for inspection.

As we have shown, the condition (a) as to residence, by section 22 of the Housing Act, 1923, has been made to have effect for only three years, and it is important to note that by section 3, subsection (2) of the Small Dwellings Act, power is given, with the permission of the local authority, to the proprietor to transfer his interest in the house, but any such transfer shall be made subject to the statutory conditions. It should also be noticed that by section 7, subsection (2) the local authority may allow a proprietor "to permit by letting or otherwise a house to be occupied as a furnished house by some other person during a period not exceeding four months in the whole of any twelve months, or during absence from the house in the performance of any duty arising from or incidental to any office, service or employment held or undertaken by him."

By section 3, subsection (3), default in complying with the statutory condition as to residence is a ground upon which the local authority can take possession of the house, and breach of other statutory conditions, whether the condition as to residence has or has not been complied with, is a ground upon which the local

authority may either take possession or order a sale without taking possession.

By subsection (4), in the case of the breach of any condition other than that of punctual payment of the principal and interest of the advance, previous to taking possession or ordering a sale, notice in writing has to be delivered by the local authority at the house calling upon the proprietor to comply with the condition, and if the proprietor within fourteen days, or an undertaking in writing to comply with the notice, and within two months complies with the notice, the local authority shall not take possession or order a sale.

The local authorities for the purpose of the Act are defined in section 9 to be the council of any county or county borough, but if the council of any urban district not being a county borough, or of any rural district pass a resolution undertaking to act under this Act, the council shall, subject, in the case of the council of a district containing a population according to the last census of less than 10,000, to the consent of the county council, be the local authority in that district for the purpose of the Act to the exclusion of any other authority. In subsection (4) of section 9 there is a limitation on the sums which may be expended under the Act. The Act has been the subject of amendment in various statutes relating to housing, but we cannot find that this provision has been relaxed. This piecemeal system of amendment is an unfortunate method of dealing with a statute of this kind intended to assist persons of small means, as it makes it extremely difficult to find all the amendments.

In the definitions of residence and ownership contained in section 10, it is stated that: "A person shall not be deemed for the purpose of this Act to be resident in a house unless he is both the occupier of and resident in that house." For the purposes of this Act ownership shall include such interest or combination of interests in a house as, together with the interest of the purchaser of the ownership, will constitute either a fee simple in possession or a leasehold in possession of at least 60 years unexpired from the date of the purchase."

There are 16 sections in the Act, but we have only referred to those which may be of most interest to intending applicants.

In conclusion, as illustrating the extraordinary difficulty of ascertaining what the existing provisions of the Small Dwellings Act, we will refer to one example. Section 49 was as follows: "A local authority for an area may, subject to the provisions of the Act, advance money to a resident in any house within the area for the purpose of enabling him to acquire the ownership of that house provided that any advance shall not exceed—(a) for the fifths of that which in the opinion of the local authority is the market value of the ownership, nor £240; or in the case of a fee simple leasehold of not less than 99 years unexpired at the date of the purchase, £300; and any advance shall not be made for the acquisition of the ownership of a house where in the opinion of the local authority the market value of the house exceeds £400."

Section 49 of the Housing Act, 1919, substituted £800 for £400 in this subsection, and substituted 85 per cent. for the four-fifths paragraph (a), as the limitation of the amount of the advance, and repealed paragraph (c). Section 22 of the Housing Act, 1923, which, as we have shown, enacts that "The Small Dwellings Acquisition Act shall have effect subject to the following amendments," and then follows the paragraphs we have set out in this article, repeals in the Third Schedule which repeals enactments the Act is referred to thus: "Extent of repeal. In section one the words from 'any advance shall not' to 'the ownership nor' and the word 'and.'"

If this repeal is applied to the section, remembering that already paragraph (b) has been repealed by the Housing Act, 1919, it will be seen its effect is only to preserve the words limiting the advance to £400, a provision already enlarged by the Housing Act, 1919, and extended by the Housing Act, 1923. It is thus that the legislature for persons of small means and possibly small education.

THE BUILDING STREETS ACT BUILDING LINE

An important decision has been given by the Court of Appeal in the recent case *Attorney-General v. Fulford* (1925, 1, Ch. 318) on section 3 of the Public Health (Building in Streets) Act, 1888. This section repealed section 156 of the Public Health Act, 1875 and enacted: "That it shall not be lawful in any urban district without the written consent of the urban authority to erect, or bring forward, any house or building in any street, or any part of such house or building, beyond the front main wall of the house on each side hereof in the same street, nor to build any addition to any house or building beyond the front main wall of the house or building on each side of the same." The principal alterations in this section as regards section 156 are that the word "erect" precedes the words "bring forward," and the word "main" is inserted before the words "front wall."

On April 7, 1924, the defendants had deposited plans with the Corporation of Birkenhead for the erection of a house and shop on a corner site fronting Hoylake-road but bounded on the west by Challis-street. According to the plans the house was to be set back from Hoylake-road 2 ft., but the Corporation contended that it should be set back 12 ft., and disapproved of the plans on this ground. The defendants intimated that they should proceed with the erection of the building, and they had done so, and this action was brought by the Attorney-General on the relation of the Birkenhead Corporation for an injunction restraining the defendants from erecting a building within 12 ft. of the road, and for a mandatory injunction to pull down so much of the house as had at the date of the trial been completed. The writ was issued July 7. The Hoylake-road is a thoroughfare carrying traffic from Birkenhead through Bidston to Wirral. It runs from east to west from St. James's Church. At the end close to St. James's Church is a steam laundry which is set back 12 ft. from the unflagged footpath on the north side of the road. The land on the north side of the road was undeveloped between Challis-street and the laundry, the distance between the laundry and the defendant's building being 700 ft. On the same side of the road, but nearly 250 yards from the laundry, is an hotel which has been built some time, but it abuts upon the footpath, which is there flagged. The defendant's house in this respect is in the same position as it abuts on the footpath, which, however, there is unflagged. On the opposite side of Hoylake-road there are no buildings until Mercer-road is reached, which runs south out of Hoylake-road, very nearly opposite Challis-street, but a trifle to the east of it.

The two questions raised by this case were (1) whether the laundry and the building in question were in "the same street" within the meaning of the section, and (2) whether if they were in the same street the relative position of the two buildings was such that the words of the section "the main wall of the house on either side" could be applied. No building line had been fixed by the Corporation; they relied solely on this section. The word "street," by section 2 of this Act, is defined by reference to section 4 of the Public Health Act, 1875, which defines a street as including "any highway and any public bridge (not being a county bridge), and any road, lane, footway, square, court, alley or passage, whether a thoroughfare or not," but is the Master of the Rolls observed, section 4 does not say that all highways are streets, and the meaning of "street" has still to be sought from a consideration of the circumstances and the decided authorities. Whether or not a road is a street has been held to be a question of fact, *Reg. v. Fulford* (1864, 23 L.J. (M.C.) (2)), *Attorney-General v. Siddall* (1898, *The Times*, June 24). In these cases it was also held that a road might be a "street" in one part whilst it was not so in another part, and that

a "street" involves more or less continuous buildings, at any rate on one side of it. The decision in the case, *Reg. v. Fulford*, was upon the Local Government Board (1858) Amendment Act, 1861, where the material words were "any house or building forming part of any street," and Chief Justice Erle is reported as saying: "I think the term 'street' refers to a row of houses in some degree contiguous and in some degree proximate to one another." Lord Blackburn put it: "Within the meaning of the Act, houses form part of a street when the houses and buildings on one side are so contiguous as substantially to form a continuous row." In the case under consideration the trial Judge had held that the defendant's house and the laundry were in the same street, and also that the laundry was a building on one side of the defendant's building within section 3.

On the first point the majority of the Court of Appeal reversed this judgment, holding that the portion of Hoylake-road between Challis-street and the laundry was not a "street." Mr. Justice Astbury, sitting as the third member of the Court of Appeal, felt some doubt upon this point, but expressed no judgment, as the second point covered the decision. This second point, as we have indicated above, was, even assuming this to be a street, could the laundry be expressed as being on one side of the defendant's building within section 3? The trial Judge had treated this question as determined by the first question, that is, having found that the two buildings were in the same street, that concluded the matter; but the Court of Appeal unanimously held that according to a long line of authorities the two questions are separate. In *Ravensthorpe Local Board v. Hinchcliffe* (1899, 24 Q.B.D. 168), the distance between the houses in question was 300 to 400 ft. The case turned on another point, that a house of which the footings were only put in had no main front wall, but the Court intimated that at this distance the section would not apply. In *Reg. v. Middlesbrough Corporation* (1890, *The Times*, July 7), the distance between the houses was 800 ft., and here again the section was held not to apply.

In *Warren v. Mustard* (1891, 61 L.J. (M.C.) 18) the distance was but 64 ft., and the Court held there was evidence to justify a conviction under the section by the magistrates. In *Attorney-General v. Edwards* (1891, 1 Ch. 194) the distance was 57 ft., and we believe the finding was the same as in *Warren v. Mustard*. In *Reg. v. Ormesby Local Board of Health* (43 W.R. 96) the distance was 70 ft., and this was held not sufficient to bring the case within the section; whilst in *In re Ellis and Ruislip-Northwood Urban Council* (1920, 1 K.B. 371, *The Builder*, April 30, 1920), where the distance was 400 ft., it was intimated by the Court of Appeal that the arbitrator should have considered whether there was such proximity as to come within the meaning of the section. These cases were referred to by the Court of Appeal in the case under consideration, mainly with a view to showing that this question of proximity was separate from the question of the buildings being in the same street, and the Court unanimously decided that the defendant's house and the laundry could not be described as one on the side of the other, within the meaning of the section. We may make one or two further observations on this case. Lord Justice Sargant pointed out that section 3 of the Public Health (Building in Streets) Act deals only with cases where there is already an existing street, and the Master of the Rolls referred to *Robinson v. Barton Eccles Local Board* (8 Appeal Cas. 798). There the case related to by-laws made under section 157 of the Public Health Act, 1875, relating to a "new street," its width and construction, and, dealing with the word "street," Lord Selborne said: "In the

natural and popular sense of the word 'street,' or the words 'new street,' I should certainly understand a roadway with buildings on each side (it is unnecessary to say how far they must or may be, continuous or discontinuous); and by 'new street' a place which before had not that character, but which, by the construction of buildings on each side, or possibly on one side, has acquired it."

In *Reg. v. Fulford Blackburn-J.*, as he then was, said that houses on one side would suffice to make them form part of a "street" when they are so contiguous as substantially to form part of a continuous row, and the Master of the Rolls in the case under consideration agreed with this statement that houses on one side would form a "street." The importance of the case, however, lies in the fact that under this section it has now been definitely held by the Court of Appeal that the fact of a road being a street does not by itself enable a local authority to use the section to define a building line, but the question also depends upon the proximity of the houses. The section, unlike its predecessor, section 156 of the Public Health Act, 1875, applies to new houses, but the house must have a house on "either side thereof," the degree of proximity that will suffice, as we have shown, may vary—it is a question of fact—and circumstances may have induced the Courts to take different views as to the degree of proximity, but there must be proximity. Lord Justice Fry, in *Ravensthorpe Local Board v. Hinchcliffe*, expressed the opinion: "I think that the expression 'house . . . on either side thereof' means a house within some near distance, within some degree of proximity and not one standing some considerable distance away." That was only a dictum in that case, but it was approved by the Court of Appeal in this case, and the Master of the Rolls put the position thus: "If you find the house relied upon is so far distant that no person in ordinary parlance would say it was the next house in the same street, you cannot hold that the section has been transgressed. There must be some reasonable measure of continuity and proximity in order to find that there is a house on either side to which the house in question must conform."

WORKMEN'S COMPENSATION

WITH reference to the note, published in our issue August 14, on the case *Briggs v. Thomas Dryden & Son*, a slight correction is required. In the middle column, page 259, it is there stated that between the repeal of the War Additions effected by section 1 of the Amending Act of 1923, and the coming into operation of the new scales of compensation provided by the Act of 1923, there is a gap, as the new provisions only apply as from January 1, 1924, and by the proviso to section 1, the War Additions Acts are only continued in respect of an accident occurring before December 31, 1923.

This is an error; there is no such gap, for the repeal of the War Additions Act in the proviso to section 1 so far as total incapacity is concerned preserves the war additions in cases where the accident occurred "on or before December 31, 1923." A correction of this point reached us too late to be inserted in the article in press, but with the exception that there is no such gap it does not affect the general observations contained in the paragraph in question as to the scales to be applied, which have received confirmation in the case *Glasgow Iron & Steel Co. v. Dickson*, in the House of Lords, which we published August 7, a case reported after the above article was written.

A Correction.

With regard to the paragraph on page 263 of last week's issue, stating that Messrs. A. & H. Crowley, of Croydon, brewers, proposed to carry out alterations to the "White Hart" public-house, North-road, Wimbledon, we are officially informed that no such work is contemplated.

NEW BUILDINGS IN LONDON.

Aldersgate-street.—A site in Aldersgate-street, E.C.1, has been cleared of old buildings preparatory to the erection of a modern block of offices and showrooms. Mr. F. Selby, 44, Chancery-lane, W.C.2, architect.

Balderton-street.—Messrs. F. & H. F. Higgs, Ltd., Station Works, Hinton-road, Herne Hill, S.E., have secured the contract for building a large motor garage and petrol service depot in Balderton-street, W.1, for Messrs. Macy's, Ltd. Messrs. Edmund Wimperis & Simpson, 61, South Molton-street, W.1, architects.

Barnet.—Additional premises are to be erected at the Barnet Girls' Grammar School, at a cost of £14,000. Messrs. Talbot, Brown & Fisher, architects, Burystead-place, Wellesborough.

Battersea.—A commencement is to be made on the conversion of Crosby Hall, on the Embankment, S.W., into a hostel for the British Federation of University Women, 92, Victoria-street, S.W.1. Messrs. Wratten & Godfrey, architects, 18, Queen Anne's Gate, S.W.1.

Becontree.—New shops and flats are to be built in Green-lane, Becontree. The builders are Messrs. F. W. Romaine & Sons, 54, Burnside-road, Chadwell Heath, Essex.

Bishopsgate.—The report in last week's issue under this heading concerning the Midland Bank, Ltd., should relate to the company's premises in Threadneedle-street, E.C.2, and not Bishopsgate.

Charing Cross-road.—The entrance and foyer of the Cinema de Paris in Charing Cross-road, S.W.1, are to be rebuilt and several stories, to be used as offices, added. Messrs. North, Robin & Wilsdon, architects, 35-38, Maddox-street, W.1. Contractors, Messrs. Bovis, Ltd., 43, Upper Berkeley-street, W.1.

Charing Cross-road.—Messrs. Metro-Vick Supplies, Ltd., have acquired premises in Charing Cross-road, W.1, which are to be converted into showrooms, &c. The contractors are Messrs. Foster & Dicksee, Ltd., Manresa-road, S.W.3. Messrs. F. Taperell & Haase, architects, Gower-street, W.C.

Chiswick.—Two new schools are to be erected in Chiswick—one in Beverley-road and the other in Staveley-road—at a cost of £40,000. Plans by Mr. E. Willis, the Council's Surveyor, Town Hall, Chiswick, W.4.

Croydon.—On the site of No. 36, North End, Croydon, Messrs. Montague Burton, Ltd., clothiers, of Leeds, propose to erect a new branch depot and shop. Plans will be prepared by Mr. Harry Wilson, 1, Victoria Park-avenue, Kirkstall, Leeds.

Croydon.—A block of flats containing 12 tenements is to be erected at the rear of Nos. 34-40, Cherry Orchard-road. The contractors are Messrs. Moreton & Sons, 171, Gipsy-road, S.E.27.

East Ham.—East Ham Corporation are to erect a new secondary school on a site in Plashet-grove, E., at a cost of about £45,000. The tender of Mr. H. C. Horswill, 183, Greek-street, Forest Gate, at £38,900, has been accepted.

Enfield.—Over 320 houses are to be erected on the Ponders End and Bush Hill Park estates at Enfield, and contracts have been placed with Mr. J. W. Rowley, Belmont-road, Tottenham, N.15, and Messrs. Kirk & Randall, Grosvenor-road, S.W.1.

Epsom.—An expenditure of some £20,000 is projected by the Epsom Board of Guardians at their hospital, on extensions to wards and a new nurses' home. Mr. H. C. Williams, architect, Ashley-road, Epsom.

Fetter-lane.—New offices are to be built in Fetter-lane, E.C.4, for Messrs. *Daily Mirror* Newspapers, Ltd., 23, Bouverie-street, E.C.4. The contractors are Messrs. Killby & Gayford, Ltd., 87, Worship-street, E.C.2. Messrs. Herbert O. Ellis & Clarke, architects, 3, Old Queen-street, S.W.1.

Holborn.—A comprehensive scheme of internal reconstruction is to be carried out at the premises of Messrs. Thomas Wallis & Co., Ltd., drapers, Messrs. Yetts, Sturdy & Usher, architects, 115, Moorgate, E.C.2.

Hounslow.—An estate at Hounslow has been acquired by Messrs. Wm. Harbrow, Ltd., 214, Rotherhithe New road, S.E.16, who intend to begin development at an early date.

Hoxton.—It is proposed to add 40 tenements to the Whitmore estate, Ware-street, E. Mr. G. Topham Forrest, F.R.I.B.A., architect, County Hall, S.E.1.

King William-street.—New office premises are being erected on a site in Abchurch-lane, E.C.3, to plans prepared by Mr. W. A. Lewis, A.R.I.B.A., 11, Finsbury-square, E.C.2. The builders are Messrs. Ashby & Horner, Ltd., 8, Aldgate, E.1.

Kingston-on-Thames.—The board of governors of the Tiffin's Boys' School have decided to erect additional accommodation. Messrs. Jarvis & Richards, 60, Tufton-street, S.W.1, architects, have submitted plans for approval.

Lombard-street.—The premises at the corner of Lombard-street and Gracechurch-street, E.C.3, are to be pulled down in order to provide for a large extension to the offices of Messrs. Barclays Bank, Ltd. The architects are Messrs. Campbell Jones, Son & Smithers, 9, Dowgate-hill, Cannon-street, E.C.4.

New Kent-road.—Plans have been prepared by Mr. J. Rawlinson, 11, Adam-street, Strand, W.C.2, for the erection of a new hall at St. George's Church, New Kent-road, S.E.1. The builder is Mr. W. G. Cearns, Carpenter's-road, Stratford, E.

New Oxford-street.—The premises at Nos. 36-8, New Oxford-street, W.1, are to be converted by Messrs. Joseph Lyons & Co., Ltd., into a branch restaurant and depot. The work will be executed by the company's building department, at Cadby Hall, W.

North Deptford.—Work has now started on the new public baths and hall in Evelyn-street, Deptford North. The contractors are Messrs. Wylie & Lockhead, Ltd., 45, Buchanan-street, Glasgow. Messrs. A. W. S. & K. M. B. Cross, architects, 45-46, New Bond-street, W.1. Quantities by Messrs. Rault & Young, 17, Southampton-street, W.C.1.

Regent-street.—The site at the corner of Regent-street and Cavendish-place, W.1, has been allocated for a new block of offices to be called "Marcol House." Plans have been prepared by Mr. Walter J. Fryer, 288, Regent-street, W.1.

Rotherhithe.—A 3-story jam factory is to be built in Stirley-street, E.15, for Messrs. Coombs, Bros. & Sons, Ltd., wholesale provision merchants, 37, Rathbone-street, E.16. The contractors are Messrs. John Mowlem & Co., Ltd., Ebury Bridge-road, S.W.1. Mr. G. N. Kent, Lic.R.I.B.A., F.S.I., architect, £21, Barking-road, E.13.

St. Marylebone.—The Governors of the St. Marylebone Grammar School, W.1, intend to rebuild their school at a cost of £44,025. Mr. G. Topham Forrest, F.R.I.B.A., architect, County Hall, S.E.1.

St. Pancras.—The L.C.C. have decided to make a grant of £50,000 to the governors of the proposed North-Western Polytechnic, which is to be erected at St. Pancras, N.W.1. The total cost is estimated by the architect, Mr. W. E. Riley, F.R.I.B.A. (Messrs. Riley and Glanfield, 6, Raymond Buildings, Gray's Inn, W.C.1), at £112,745.

Stamford-street.—Plans have been prepared by Mr. Thomas John Fox, 1, Museum-street, W.C., for the erection of an office building in Stamford-street, S.E.1, for occupation by the Cornwall Press, Ltd., Paris-gardens, S.E.1.

Strand.—Plans have been prepared by Messrs. W. & E. Hunt, F.F.R.I.B.A., 30, Norfolk-street, Strand, W.C.2, for extensions to the Howard Hotel in Norfolk-street, Strand, W.C., which is to be completely modernised.

Stratford.—An addition is to be built at printing ink works, in Sugar House-lane, E.15. Messrs. B. Winstone & Sons, Ltd., Shoe-lane, E.15. Messrs. Fairbrother, Ellis & Co., architects, 29, Fleet-street, E.C.4.

Streatham.—The Crooke-Ellison Estate, Greyhound-lane, S.W., has been acquired by Messrs. R. H. Miller & Son, Ltd., Ravenstone-street, S.W.12. A large number of streets are to be laid out prior to the erection of houses of different classes.

Tooting.—A row of seven shops is to be erected on a corner site, Upper Tooting-road, S.W., Messrs. E. Mortimer (London) Ltd., 9, N. Bridge-street, E.C.4. Messrs. Burdwood Michell, architects, 80, George-street, Hanover-square, W.1.

Westminster.—Mr. F. E. Williams, architect, 34, Henrietta-street, W.C.2, has prepared plans for the erection of two town residences in Tufton-street, Westminster.

Woolwich.—A large building of six floors is to be erected in Westfield-street, S.E.18, Messrs. Siemens Bros. and Co., Ltd., electrical engineers. The contractors are Messrs. Humphreys, Ltd., Knightsbridge, S.W.1. Plans have been prepared by Messrs. Siemens Bros.

TRADE NEWS

We are informed that Mr. Ormerod Mitchell has now taken up his position as General Manager of the Ransome Machinery Company (1920) Limited.

We understand that the Lamson Pneumatic Tube Co., Ltd., have recently received contracts for cash tubes from several leading firms, among these being Messrs. Swan & Edgar, Ltd., Messrs. Lewis's, Ltd., Manchester, Messrs. H. Binns & Co., Ltd., of Sunderland, Darlington, Middlesbrough, Messrs. Marshalls, Ltd., Leeds, and Messrs. Bainbridge & Co., Ltd., Newcastle.

Rock Asphalt.

We have received a booklet dealing with rock asphalt produced by Messrs. J. Dickinson & Co., Ltd., Bolton. This patent material, virtually "mineral rubber," and its makers claim that its characteristics include watertightness, dustlessness, noiselessness under traffic, resiliency, good appearance, fire resistance, and hygienic properties generally. Rock asphalt consists mainly of a limestone aggregate impregnated with a high-grade bitumen of natural pitch, the rock being ground and graded and cooked with the bitumen. The booklet describes, and illustrates with actual photographs, typical instances where the asphalt has been satisfactorily used; these include playgrounds, roads, drill-hall, factory and mill floor, flat roofs, tank work, damp-courses, &c. It also gives a short treatise on the repairing of broken concrete or flagged floors by an ordinary handyman, and another on the lining of tanks.

Safety (Ladder) Brackets.

Messrs. Hall, Phillipson & Co., Ltd., 1, Victoria-street, London, S.W.1, have introduced to the British market the Seaman safety (ladder) brackets of which thirty thousand sets are now in daily use in America alone. The brackets are made from special drop forged steel, tensile strength 14,000 lbs., average load at elastic limit 6,500 lbs., safety working load 2,700 lbs. and weight 5 lbs. 10 ozs. per pair. One bracket is fitted to each side of the top of the ladder, upright, the socket being so arranged that it slips over, and a few turns of the two forged steel screws engage and rigidly fix the bracket to any size of ladder. When attached to a ladder the brackets have a span of 42 inches and hold the ladder out from the wall 14 inches. It is claimed that in addition to affording security these brackets have the virtue of being a time and labour-saving device. We are informed that they are recommended by the "Safety First" Councils, and that Insurance Companies advocate their use wherever ladders are employed.

(For rates of wages in the Building Trade in Scotland, see page 303.

CONTRACTS, COMPETITIONS, &c.

For some contracts still open, but not included in this List, see previous issues. Those with an asterisk are advertised in this number. Certain conditions beyond those given in the following information are imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in; the name and address at the end is the person from whom or place where quantities, forms of tender, &c., may be obtained.

BUILDING, PAINTING, ELECTRIC LIGHTING, HEATING, etc.

The Smoke Nuisance : Winter's Campaign.

A Smoke Abatement Conference is to be held at the Palace Hotel, Buxton, from Friday evening, October 2 to Monday morning October 5. The meeting is being arranged by the Smoke Abatement League of Great Britain, and support has been promised from many influential quarters. Certain practical proposals for reducing both domestic and industrial smoke are being prepared by the League for full consideration by those attending, and prominent individuals have agreed to open the discussion at the various sessions. It is hoped that a constructive programme of useful work will be initiated the results of which can be reviewed at the Smoke Abatement Exhibition and Conference at Birmingham in 1926. The headquarters of the Smoke Abatement League are at 33, Blackfriars-street, Manchester.

PROPOSED NEW BUILDINGS & OTHER WORKS*

In these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works at the time of publication have been actually commenced. Abbreviations: T.C. for Town Council; U.D.C. for Urban District Council; R.D.C. for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; B.C. for Borough Council; P.C. for Parish Council; M.H. for Ministry of Health; M.T. for Ministry of Transport; C.B. for County Borough; B.E. for Board of Education; M.A.B. for Metropolitan Asylums Board; and M.W.B. for Metropolitan Water Board.

ALDERSHOT.—Hampshire E.C. are to borrow £3,550 for the provision of temporary school buildings for the Aldershot secondary school.

ALLERTON.—The Parish Council has received notification from the West Riding C.C. of their intention to erect a new Public Elementary school, at Great Preston. The school will be available for Great and Little Preston, Kippax, Swillington, and Allerton Bywater, and will provide accommodation for 450 children.

ALTRINGHAM.—Plans have been submitted for the erection of 24 houses at Ellesmere-road and Hawarden-road.

ASHBOURNE.—The U.D.C. are to apply for permission to proceed with the erection of 22 houses on the housing site, and for sanction to borrow £12,000 for the scheme.

ASHTON-UNDER-LYNE.—The Housing Committee propose to erect 51 houses in Pelham-street and Birch road, West End. The E.C. have approved plans for alterations to Christ Church Schools, Littlemoss, estimated to cost £1,450.

AUDENSHAW.—Messrs. Roberts Nobletts, Ltd., propose to erect 12 houses in Ashworth-street and Sidmouth-street.

NEW BUILDINGS IN SCOTLAND

BURGH.—The Dean of Guild Court passed following plans at their last meeting:—four houses at Hutchison Crossway; electricity sub-station at Chesser-avenue; alterations at fire station, Laurieston, per the City Architect; eight flatted villas at Averockbank-avenue, for Holiday Real Estate Co., Ltd.; 10 semi-detached houses at Rosebank-road and Rosebank-road, for Edinburgh Urban Building Society; sausage factory at Moor-road-lane, Leith, for Leith Provident Co-operative Society, Ltd.; shop and eight flats at St. John's-road, Corstorphine, for St. John's Co-operative Association, Ltd., per Mr. Marwick, architect.

GLASGOW.—The Dean of Guild Court has passed the erection of five blocks of two-tenement houses, four houses in each tenement, estimated cost of £7,900.

GLASGOW.—The Ashton U.F. congregation have passed plans for the erection of a church in place of that destroyed by fire. The estimated cost of the building is £11,000.

GLASGOW.—Houses.—A private company has started a scheme for the erection of 152 houses in the Arbroath-road and the Broughty road. The plans have been approved of by the City Engineer.

GLASGOW.—CHURCH.—The Presbytery of Arbroath proposing to provide a new church at Prestwick. The U.F. Church Presbytery will be asked to discuss the question.

GLASGOW.—Triangular Construction Co., Ltd. staff and employees of this company spent an enjoyable day in a trip by motor-coaches to Hastings. Throughout the day the deuce was available of the most friendly ship between the management, staff, and employees.

A Correction.

In reference to a paragraph on page 156 of the issue for July 24, stating that an addition to be built at their works, we are asked by The Kenbar Engineering Co., of Kilburn, to state that no such work is contemplated.

PROPOSED NEW BUILDINGS

(Continued from page 301).

PRESTON.—The T.C. have resolved that application be made to the Ministry of Health to borrow the sum of £19,700 for the re-surfacing of cobble-paved streets.

RADCLIFFE.—The U.D.C. propose to acquire the Bealey Convalescent Hospital for use as a maternity home. The cost of equipment and electric light installation is estimated at £1,450.

RAMSBOTTOM.—The U.D.C. resolved that the houses to be erected on the Bolton-road, Northside, be of the non-parlour type and semi-detached; that the work be carried out by contract, and that Mr. T. H. Bell be appointed architect for the scheme.

RATHMINES.—The U.D.C. has decided on the laying of a water main from Bohernabreena to Ballyboden and the erection of another filter bed, at a total cost of £26,500.

RAYNES PARK.—Surrey E.C. are in negotiation for a site in the vicinity of Raynes Park Golf Club-house for the erection of a school to replace the Ashton-road temporary school, and for future developments.

READING.—St. James' Church is to be enlarged at an estimated cost of £6,500.

REigate.—A secondary school is to be erected for girls at a cost of £38,000.

RETford.—At the meeting of the T.C. it was agreed that the remaining portion of the undeveloped part of the Hallcroft Housing estate at Retford be proceeded with, and the Borough Surveyor prepare plans and obtain estimates for 24 non-parlour type houses which the Council propose to erect.

ROYTON.—The D.C. have decided to apply to the M.H. to borrow £28,000 for housing purposes.

RYTON.—Preliminary plans for a new elementary school are being prepared by the Durham County E.C.

SACRISTON.—Further consideration is being given by the Durham County E.C. to plans for extensions at the elementary school.

SADDLEWORTH.—The W.R. Council are to invite tenders for the erection of a new police station at Upper Mill to the plans of the County Architect.

SALFORD.—The North Salford Labour Party has decided to purchase "Victoria Lodge," Lower Broughton, for the purposes of a new club.

SHOTTERMILL.—Surrey E.C. now propose to proceed with the erection of an elementary school.

SIDMOUTH.—The U.D.C. are proposing to carry out a scheme for the erection of a breakwater at an estimated cost of £60,000.

SOLIHULL.—The Solihull United Charities have prepared a scheme for new buildings at the Solihull Shire Church of England School.

SOUTHPORT.—The Town-Planning Committee have decided to apply to the M.H. for sanction to borrow over £102,000 for the acquisition of land and erection of houses.

SPLSBY.—The M.H. has approved a scheme proposed by the R.D.C. for the erection of 22 houses in various villages in the area.

STOCKTON.—The T.C. has instructed the Borough Engineer to prepare an estimate of the cost of providing a new small-pox hospital, embracing an administration block, accommodation for 36 patients, and foundations for two further blocks, each to hold twelve beds.—The Council has obtained sanction from the M.H. to raise £49,211 for the erection of 120 houses on the Blue Hall Estate.

STYNDERLAND.—The Health Committee recommend the erection of 45 houses.

TANFIELD.—The U.D.C. has obtained sanction from the M.H. to purchase land at Crookgate, near Burnopfield, for the erection of 46 houses.

TRURO.—The Corporation have decided to give the subsidy to the Great Western Railway (Truro) Housing Society for 36 houses proposed to be erected. Messrs. Cowill, Drewitt & Wheatley have prepared a scheme for the development of building land at Green-lane and Falmouth-road.

TYNEMOUTH.—The T.C. are proposing additions and improvements to the bathing pool at a cost of £15,000.

USWORTH.—Arrangements have been made by the Durham County E.C. for the purchase of a site at Usworth Colliery for the erection of an elementary school.

WANSTEAD.—A site has been acquired in Cambridge-road for the erection of a proposed new R.C. church.

WARMSWORTH (SOUTH YORKS.).—Plans have been prepared for the erection of a new open-air school at an estimated cost of £19,500. Plans have been prepared by the architects' section of the West Riding C.C.

WARWICK.—Warwick County Architect has prepared plans for a school, and accommodation for stores, steward's quarters, &c., at the King Edward Memorial Sanatorium, and these have been submitted to the M.H. for approval.

WEST ACKLAND.—Durham County E.C. are preparing plans for an elementary school.

WEST HARTLEPOOL.—The T.C. has prepared plans for the erection of 278 houses at Rift House, and is making application to the M.H. for sanction to erect 113 houses by direct labour on the north side of Oxford-road, at an estimated cost of £435 each for parlour type, and £380 for kitchen houses.

WEST RIDING.—The C.C. are to carry out several important schemes as follows:—Extensions at Temple-street Council school, Castleford; new secondary school at Malby, for 300 pupils; extensions to the Doncaster Technical College, at an estimated cost of £20,000; provision of new temporary accommodation at the Doncaster Grammar School; extensions to Normanton Grammar School, at an estimated total cost of £20,000; a new Mining College and Institute to be erected at Dinnington, at an estimated cost of £21,500. Tenders amounting to £18,208 have been accepted for carrying out a scheme of extensions at Otley Grammar School. The Council also proposed to provide a new "middle" school at Featherstone, with accommodation for 360 pupils.

WETHERBY.—The West Riding C.C. has secured option to purchase a site comprising 122 acres at Linton, near Wetherby, for the erection of a sanatorium for treatment of tuberculosis.

WHITEFIELD.—The D.C. are to acquire land fronting Bury New-road for use as playing fields. A new road is to be constructed from Old England, Bury New-road to Bury Old-road, Kirkhams, to relieve the main road traffic.

WOKING.—Surrey E.C. has decided to proceed with the scheme for the erection of an elementary school at Westfield.

WOLVERHAMPTON.—It has now been arranged to buy the present Telephone Exchange adjoining the Town Hall—the site for the new Public Hall—for £4,800, and a site for the new Exchange is being found by the Corporation in Red Lion-street.—Mitre Fold is to be demolished, and a new street constructed so as to provide an island site for the new Public Hall.—Fourteen new houses for the police are to be erected on land in Red Lion-street, which is to be widened to 36 ft.

WOOTTON.—Warwick County E.C. have decided to erect a school for 100 children.

BUILDING TRADE WAGES IN SCOTLAND.*

The following are the present rates of wages in the building trade in the principal towns of Scotland. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

	Masons.	Brick-layers.	Car-penters, Joiners.	Plas-terers.	Slaters.	Plum-bers.	Painters.	Brick-layers' Labourers.
Aberdeen	1/3	1/8 1/2	1/8	1/8	1/3	1/3	1/7	1/0 1/2

CXXIX.—No. 4,308

AUGUST 28, 1925

"OVERCROWDING"

There are to-day some 12,000 architects and students in England and Wales.

THIS is the outstanding fact by which the recent excellent report of the Special Joint Committee on the alleged overcrowding in the architectural profession will be remembered. That this figure, alarming as it appears, has not been forced up by the popularity of architectural schools is an important corollary which immediately follows; without the schools we might have less qualified architects but more men in practice. While few will disagree there exists sufficient scope for qualified men—if those built were prepared to recognise the necessity of employing architects—still the figure 12,000 remains and must cause much anxious thought to parents and to many men already in the profession. Put quite frankly, what are the prospects of a man without capital or special interest of becoming reasonably self-supporting at the age of thirty-five, let alone of keeping a family and providing for the future? Surely the answer, if made to a student who consulted one as to a lad's future, cannot be optimistic. Architecture as a profession for the man of average ability is certainly precarious: it may be disappointing, and may end in a complete failure. First, there is the long and expensive training, then a period of employment—probably temporary from office to office, with gaps between; this may be succeeded by permanent work and perhaps a share in a business that would amount to little more than an uncertain salary. As an alternative there is the job abroad, often only a cul-de-sac, but the prospect of even a small assured future is not one that can be looked for, and the more truthful we can be on this point the better for all concerned.

If a young architect cannot call upon hereditary influence or an established firm or depend upon outside influence for a steady practice," says a correspondent, "he can only be an underling and he cannot expect to earn more in the open market than would any reasonably well-trained clerk after a short time at the Polytechnic and a small practical experience. In brief, architecture—and the sooner we face this the better—is not a profession, and it holds no attraction for the average bread-winner. That average men, and men above the average, have done extremely well for themselves in architecture is not to be denied, and miles of our cities and suburbs exist as monuments to their successful mediocrity; but if we look into it we shall find that those men have had openings in existing practices or that they grafted their architecture to property management, surveying, and speculation. They were cogs in a larger wheel, professional men who were concerned with buildings. It was as business men and not as architects that they made good, and with the passing of time their estate as a paying concern their opportunities have been diminished and will diminish still further." The health of architecture appears to depend first upon the vitality of this quasi-architectural business element better trained than the average of the schools comes in. We cannot force a commercial man to make his surveyor, engineer, or builder. Let an architect, but we can encourage surveyors, engineers, and builders to let their sons study architectural principles and if the course is short, to learn where architectural pitfalls lie. A strict trade union attitude is hardly likely to help matters; it certainly will not help architecture. The vital element to a sound body appears to lie in the heaven within the man, represented by those men—architects in the fullest sense—who are above the average and who are ready to risk everything for good. Men such as these, who care enough for the profession to face uncertainty and sacrifice, deserve the reward

if the opportunity is won. In this spirit architecture is only taking her place with the other fine arts, none of which have ever been regarded by parents as assured careers. Artists may be successful—extremely so—but their callings are not thereby scheduled as suitable for average men or for men who have failed in other directions. This neglect has spared the other arts the load of well-meaning mediocrity common to professions, although it may have increased their proportion of cranks and egoists. It is only as an adventure that art can keep her spirit keen; she offers uncertain opportunity for fulfilment in exchange for deliberate routine and safety, and her reward is in herself. It is because architecture is so closely associated with the practical side of life and living, with law, mathematics, and sanitation, that she has allowed herself to become a profession, however honourable, and not a calling in the vocational sense. In so doing she has lost caste, and architects—despite their practical qualifications—find that they are not consulted. Before accepting this charge let us meet the objection that many clients only consult architects over the mundane details, while they reserve the important side of decoration to themselves, although they generally add the remark that "architects build pretty houses but they know nothing about the practical side." Surely this contradiction springs from the same error—that architectural values in everyday life have been allowed to fall, and are regarded as an applied extra, subject at best to the caprice of taste?

It is a curious anomaly, peculiar to priests as well as to artists, that their power and influence in common dealings with common men depends upon their own uncommon outlook. The athletic East End parson does not owe his influence among men to the habit of wearing flannel trousers and talking heartily of "fish and chips"; the artist whom men follow is he who puts the message of his art in front. Architects have to make people see that good building and beauty are interdependent, and that the unity to be sought is far higher than practicality or decoration alone, but to do this effectively they must bear witness to the reality and the intrinsic value of art; they must show that it cannot be encompassed by the ignorant. What well-dressed woman without a course of training would presume to make her own ball gown or to cut out her husband's new suit? Yet the same woman would think it a foolish extravagance to pay for architectural advice over the alterations to her home. You would find her deferring humbly to the suggestions of someone on the proposed bow window, or object before the expert dating her period drawing-room suite, but these oracles would be dealing with recognised data, not with taste, and taste (she believes) is her own.

Until architects as a body emphasise the vocational significance of their art they will not ignite public imagination. Ugliness will be tolerated and architects will only be employed to ward off the attacks of supposedly rapacious tradesmen. But how, it may be asked, are architects to do the insisting? Perhaps the answer is not so complicated—by believing in the vocation themselves. Conviction carries itself, and no one with an acquaintance of architecture to-day can doubt the zeal and enthusiasm of the young men and women who are leaving the schools and invading the offices throughout the country. The corporate influence of these centres has created an impetus which must push architecture into touch or into conflict with ordinary life and other professions. Even granting this new enthusiasm, the end is not yet in view, although we may say that public feeling is looking up. For the man of venture with only himself to keep architecture can hold out possibilities and openings; it introduces more delightful by-ways than any other calling, it invites the widest culture and the widest response, but its favours are uneven and can never be assured. Facing this without illusions we can recommend the adventure to our bolder spirits, offering them the consolation that the less the certainty the greater the virtue and the value of the end.

NOTES.

The Oxford Colleges. INTERESTING building operations are being conducted at present on several of the Oxford Colleges, of which members of the R.I.B.A. Conference last year will have happy memories. A block of buildings at Magdalen, close to the Deer Park, erected in 1735, is being refaced with bath-stone, as the stone from local quarries has crumbled away. Similar work is in progress at All Souls, New College, St. John's and Christ Church. At Worcester, writes a correspondent, "where the local stone has suffered very seriously, an experiment has been tried on the advice of a well-known architect of inserting in the decaying stone pegs made of pieces of red tile. These are covered over and surrounded with cement. This is of course far more economical than replacing with new stone, and the other Colleges are watching to see if this method is satisfactory."

The Amenities of Oxford. JAZZ electric signs, we are informed, are not to be allowed in the City of Oxford under a Town Planning scheme that is at present under consideration. It is felt that night signs having the appearance of intermittent illumination and roof signs are quite out of place in the University City, and accordingly it is proposed under the preliminary scheme to prohibit these. Power is also to be taken to

prevent the erection of buildings of a height greater than 50 ft., exclusive of chimneys, towers and turrets. The area, as approved by the Ministry of Health, covers nearly 20,000 acres in all, and if confirmed Oxford will be the first city in Great Britain to obtain powers to control her built-up area. At present a cinema could be put up next to Christ Church, or a mammoth store opposite Magdalen, or a galvanised sheet iron garage close to Balliol. In view of the immense number of American and other visitors during the summer the City Council consider it imperative for commercial as well as for æsthetic reasons to safeguard the character of their City and to improve its amenities.

East Kent Coal Fields. THE bitter experiences arising out of industrial development in Lancashire, the Potteries and the Black Country has led to a report being prepared by Professor Abercrombie, of the Department of Civic Design in Liverpool University. This report has in view to suggest how the transformation of East Kent into a busy mining and industrial area from an agricultural countryside can be effected without destruction of its rural and traditional character, and grave injury to historic towns such as Canterbury. That much can be done in that way we are inclined to doubt, at the same time the use of electricity for power for the mines and other industries, and also some considered plan for housing may

mitigate the worst of the evils of the side of industrialism. The destruction of this fair domain of Kent and the injury to historic cities such as Canterbury is a very serious matter. After all, the country side and its traditional associations have their value to trade also, and to exploit the mineral resources to the destruction of much else may have it serious loss as well as gain.

Village Industries. AN account in *The Times* of a village industry, which quite a number of disabled men are occupying, is part of a very wholesome quickening of country-life. There is much scope for the development of rural prosperity in adding to agriculture other sources of livelihood, for which the winter months provide plenty of time. No doubt in spring and summer the allotment or garden occupy a great part of the leisure after working hours, but even then, were the training forthcoming there is a good deal that could be done, and we hope that the efforts towards establishing small workshops and home industries will extend themselves in such a way, and retaining the local character which is, in other words, retaining the freedom for personal idiosyncrasy—craftsmanship however humble at the start—may yet prove the way to a better tradition of craftsmanship, which should gradually supersede mechanical alternatives. It does not pay to make cheap goods on a small scale, nor is it possible

THE "BERKELEY" CHAPEL FROM S.E.

THE "BERKELEY" CHAPEL AND SACRISTY FROM S.W.

Bristol Cathedral Renovation. MR. ROLAND W. PAUL, F.S.A., Architect. (See p. 313)

the village industry to sell on competitive terms with the mass producers, but work itself being better, justifies a more being paid for it, and if it is to the locality supplying its own needs in these directions, we should not see that variation of character, stamp of locality, once more taking place of the dullness of standardisation.

Richborough. A STRONG case is made out in a letter signed Leslie E. Ludlow Jones, for the careful exploration of the site at Richborough. There are all definite traces of the Romano-British occupation here are lost to us. There seems quite sufficient evidence ready to hand to suggest the great interest which would accrue from a systematic and careful oversight of the site and before it is too late.

The Foundling Hospital. ONE by one the old landmarks pass away, but not without regret or more compunction than was the case when the restorer had his way, and we are glad to see the suggestion made that some should be taken to preserve the buildings of the Foundling Hospital. These buildings have historic interest, and are associated with the London of the 17th and 18th centuries, the features of which it should be an object to retain as much as possible. The house and grounds were laid out to retain for the locality the features of the old place, it would be of much advantage to the associations of London. Not some compromise possible by which some of the land would be taken over for the buildings and the rest of the land reserved? We do not know whether the London Society has in view to promote action to this effect, but we feel sure that if public opinion mobilised there would be found much support for the proposal. London commercial enterprise is not sensitive to the claims of beauty and associations where its interests are concerned; it therefore requires those who have the public interests at heart to bestir themselves.

District Surveyors' Fees. A CORRESPONDENT writes:—"Builders' estimates for works in the County of London will be affected from October by a further reduction of 10 per cent. on District Surveyors' fees. This means that the scale of fees as finally provided in the several Acts and By-laws in force will be increased by 10 per cent. instead of 37½ per cent., as at present. Thus will calculation be simplified and a small benefit will accrue to everyone concerned, except District Surveyors."

Forthcoming Exhibition. It has been arranged to hold a collected exhibition of the work of Mr. Reginald Hallward in the Galleries of the R.I.B.A. this autumn. The exhibition will remain open from October 1st to the 17th, and will include

examples of the artist's work in its various directions—pictures, studies, drawings, cartoons for stained glass, mural painting, &c., and also the original completed models of the Imperial Memorial Tablets executed by him in collaboration with Lt.-Col. H. P. Cart de Lafontaine, some of which have already appeared in our pages. The note of personality in Mr. Hallward's work is its chief characteristic, and we look forward with interest to the exhibition in October.

Town-Planning Institute. THE seventh annual country meeting of this Institute will be held at Canterbury from October 2 to 4 inclusive. The meeting will open on Friday. A detailed programme will be issued in due course, but it is proposed to devote most of the time available to the study of a question which we have already discussed from time to time, *i.e.*, the future development of the Kent Coalfields area, both by discussion and inspection. The meeting is not confined to men and members only. Particulars can be obtained from the Secretary, Mr. Alfred R. Potter, 11, Arundel-street, Strand, W.C.2.

Notes on Slate. ONE of the best little handbooks of its kind which we have seen is the "Slates of Wales" which has been written by Dr. J. F. North on behalf of the Press Board of the University of Wales. The information in this monograph is well arranged and well conveyed, and should be of real value. The University has done well to issue such an informing treatise on one of the commercial assets of the principality. Amongst the illustrations is a remarkable one of the Dinorwic Quarry, Llanberis. We notice amongst the various uses of slate the author has apparently overlooked its great value as a material for decorative carving, as some of our finest old memorials are of carved slate. As to the great value of slate as a roofing material, Dr. North points out that the best Welsh slate absorbs less than one six-thousandth of its own weight of water; it is practically impervious to water, and consequently not liable to be spoilt by frost; whilst it is incombustible and a poor conductor of heat, and practically unaffected by air charged with corrosive gas.

London University School of Architecture: A Double Bungalow.

By MR. H. JOHNSON (Fourth Year). (See p. 326.)

GENERAL NEWS

Professional Announcement.

Messrs. Norris & Slattock have moved from 26, Buckingham-gate to 14, Victoria-street, London, S.W.1.

Capt. W. D. Roderick, D.S.O., M.C., architect and surveyor, Borough Chambers, Wharton-street, Cardiff, has moved to Alexandra Chambers, 119, Queen-street (entrance Windsor-place), Cardiff. Tel. 7475.

The Foundling Hospital.

The Foundling Hospital site and estate in Bloomsbury, comprising in all about fifty-six acres, have been sold at a price of £1,650,000.

Strand.

The Roads Committee of the L.C.C. propose to experiment in the near future with one-way traffic in the Strand.

Manchester Housing Problem.

There were 6,000 applications for the 842 houses which the Manchester Corporation propose building.

R.I.B.A. Examinations.

The questions set at the Intermediate and Final (or Special) Examinations held in May and July, 1925, have been published, and are on sale at the Royal Institute, price 1s. 6d. (exclusive of postage).

Empire Theatre Site.

The Metro-Goldwyn Film Corporation of America and the Jury Metro-Goldwyn Company of London propose to buy the Empire Theatre in Leicester-square, with a view to demolishing it and erecting on the site a super-cinema, at an estimated cost of £1,000,000.

Architect's Estate.

Mr. James Franklin Fuller, of 51, Eglinton-road, Donnybrook, Dublin, Architect to the Representative Body of the Church of Ireland, the Benchers of the King's Inns and the National Board of Education, Ireland, left personal property in England and the Irish Free State valued £32,216.

The Organ of St. Paul's.

The great organ of St. Paul's, which has had to be taken down from its position within the choir to make room for the work of strengthening the fabric of the Cathedral, is about to be rebuilt on the north side of the nave, where, since the closing of the choir, the services are being held.

Oxford Town Planning.

After next Friday the City Council of Oxford propose to consider a resolution adopting a preliminary statement of proposals for town planning an area within three miles of Carfax. This area has been approved by the Ministry of Health. If the town-planning scheme is adopted it is hoped that it will not only protect the character of the University city, but will also improve the approaches, which are at present extremely unsightly. The whole of the area covers 19,004 acres.

Shannon Power Works.

Preliminary work on the Siemens-Schuckert Shannon scheme has begun in Co. Limerick. Railway connections must be built between the harbour and Limerick Railway Station and also from Long Pavement to Ardnacrusha, where the power station is to be erected. The railway work is expected to be finished by December and it will employ some 600 men.

St. Michael Royal Reopened.

The church of St. Michael Royal, College Hill, E.C., one of Wren's churches in the City, after having been closed for renovation for nearly seven weeks, was reopened recently. The renovation scheme included the painting of the walls and ceilings and the moving of the heavy altar railings forward to form a chair screen. The statuettes of Moses and

Aaron, which originally stood on pedestals beside the altar, have been accommodated in niches in the walls some few feet above their former location.

Roman Pavement at Colchester.

A Roman tessellated pavement has been presented to the Borough of Colchester by Mr. H. Lazell. It was discovered in a garden at the rear of a residence on North Hill, within the walls of the original Roman city. The markings are extensive and of unique design, the centrepiece being in the form of a circular medallion. Colourings of black, white, and red have been introduced. The whole nine feet square is practically complete and will be moved to the museum.

Sea Erosion at Lyme Regis.

The coast district at Lyme Regis is again imperilled by the sea, and already a considerable section of the coast road, which is the main artery from London to Devon, has been rendered useless. A serious feature of the erosion in the borough of Lyme Regis itself is the menace to the old parish church and churchyard. There is a protecting wall, but this is now insufficient, and Sir Francis Fox has written to the Parish Church Protection Committee urging that the wall be extended.

Building Surveyors' Association.

We have received a copy of the syllabus of the Building Surveyors' Association examination which will be held in October in London. For the purpose of providing educational advancement and means of organisation for all building surveyors and inspectors or others engaged by local authorities in a supervisory capacity in connection with building works, this Association was formed. Members of the association are classified as "Members," "Associates," and "Students," according to their qualifications. Intending candidates should apply for the syllabus and permission to sit to the Secretary, Mr. Morris Crossland, A.M.I. Struct. E., 42, Highfield-road, Bramley, Leeds.

The Roman Site, Richborough.

Mr. J. P. Bushe-Fox, Inspector of Ancient Monuments, Office of Works, who is directing the work of excavation which is going on at Richborough, the site of the reputed Roman city of Rutupiae and the port of Roman England, near Sandwich, Kent, agrees with the opinion expressed by Mr. Ladlow Jones in his letter to *The Times* recently, that exploration of the area of land outside the walled fortification would furnish valuable information of the system of town planning in vogue in a Roman-British town. It appears that the owner of the land is willing to sell it for building purposes, and the feeling of antiquaries, impressed with the importance of the Roman remains found within the walled fortification, is that it would be a disaster if houses were put up there until at least the ground was explored first.

Road Works, Bond-street, W.

In the course of road repairing works in Bond-street, under the old roadway cavities more than a yard deep have been discovered, and these show that for some time past the omnibuses passing along this street have been supported merely by a layer of concrete 6 in. thick. It is suggested that hidden water currents may have drained away the earth on which the concrete rested, or that old trenches which formerly crossed the site were carelessly filled. At the request of the Bond-street Traders' Association the authorities have agreed to carry out the repairs very rapidly. Only five weeks are allowed for the contractors to complete their task of breaking up, deepening, and relaying about 9,000 square yards of roadway. The new concrete foundation, 12 in. thick, will be made with the new rapid-hardening cement which reduces the period of hardening to about one-seventh the time formerly required.

STUDIOS, GLEBE-PLACE, CHELSEA

These two studios, which were built for Derwent Wood, R.A., are situated at the bottom of Glebe-place, facing King's-road, and designed to harmonise with the rep. Henry VIII's hunting lodge, which adjoins. The architects' chief concern in this case was to provide as much light as possible, as they realised that light is among the most important parts of an artist's equipment. Each studio has a gallery on one side, on the lines of "souponte" of the Parisian atelier, and has in addition a model's room with a bath adjoining. Hand-made, sand-faced, multi-coloured bricks laid with a flush joint were for the outside walling, and hand-made, sand-faced pantiles for the roofs, which were of construction. The architects were Messrs. P. Tubbs, Son & Duncan, F. and A.A.R.I.B.A., the following is a list of the sub-contractors: General contractors, Messrs. Edcatter, 199A, Goldhawk-road, Shepherd's Bush, W. bricks, Messrs. Thomas Lawrence, Brackley Berks; door and grate furniture, Messrs. J. Gibbons, Ltd., Fisher-street, Southampton-W.C.; electric lighting, Messrs. Bell Bros., South Molton-street, W.; studio windows, British Challenge Glazing Co., Stratford, E. grates, Messrs. Bratt, Colbran & Co., Mortimer-street, W.; heating, Messrs. Mulliner, Ltd., 72, Harrow-road, W.2.; rain-water heads, Messrs. Cashmore; steelwork, Messrs. Moreland, Hayne & Co., Ltd., Goswell-road, E.C.; tiles, Messrs. William Br & Son, Redhill, Surrey.

CORRESPONDENCE

[While we are glad to publish letters on professional and other matters of interest to our readers, it must be understood that we do not necessarily endorse the remarks of correspondents, who will oblige us if they will express their views as briefly as possible.]

The New York Cathedral and Some Theories.

SIR,—Referring to your correspondent's reply to my letter, I should like to say that, in spite of his disclaimer, his attitude as further defined still seems to me to amount to an entire disavowal of modern Gothic, against which he amasses all kinds of adjectives and objections. If I may be allowed to expatiate a little on my own thesis, I think I can incidentally counter these objections. But first let me deal with his suggestions towards an alternative. I must confess that I find them, as indicated, far too nebulous to be useful. But I should much like to learn what higher inspiration is offered by this exotic idealism of his than by our own native Christian tradition; how he is going to get a "corporate impulse" behind it, as far as we are concerned; and how going to placate the industrialism that he (rightly) considers so hostile to mediævalism. There are those, of course, who base their hopes upon the said industrialism itself, associated with such inherently inferior materials as steel and concrete. I own I can see but little promise of artistic results in this direction. Ferro-concrete optimists may well be referred to certain designs (some of them ecclesiastical) at present on view at the Paris Exhibition. However, let the new art (whatever it be) evolve—a lengthy process in any case—and let it justify itself in a chapel before it adventures on a cathedral; or, to take a glance at a kindred matter now engaging your columns, in a tenement before it embarks upon a thoroughfare, lest the "revelation" be one of oddity instead of Art.

In the meantime we are, as stated, without any living common tradition in design and craftsmanship; the Blessed Renaissance and the Blessed Industrial Revolution between them saw to this. It is the misfortune of the age. But we cannot, therefore, cease our activities; we must proceed somehow. My own contention is that mediæval architecture offers, in highly important aspects, a suitable vehicle or basis for modern work. Now I am far from forgetting or denying (as suggested) the irrecoverable elements of ancient art—what one may describe as those of temperament and circumstance, with all their singular charm. But these are by no means all that go to the making of an architecture. "Gothic" has the peculiar advantage (especially as against "Classic") of being a coherent organic mode of building, affording, I repeat, permanent inspiration and example. I hold that those who have the needful gifts can so assimilate and treat this precedent as to produce works of art possessing merits both independent and derived; adaptive and interpretative work rather than imitative, and hence neither shams, nor unrealities, nor copyism, nor caricature, to select a few of the copious question-begging terms in use by critics in the other camp. Can it be denied in fact that the later masters of the Revival have produced works of this order, and notably in religious buildings? A Gothic not necessarily of the complete original brand, but a Gothic eminently worth while, and often recapturing to a remarkable extent both the form and feeling of its exemplar. One might almost argue that the Gothic Revival partook of the nature of a "corporate impulse." In this connection, however, those who insist on the paramount importance of this factor may be reminded that mediæval architecture was not altogether the impersonal, elusive, quasi-automatic kind of art they seem to suppose it—a thing, as it were, independent of definite principles and leadership. The individual, the school, even the "drawing office" in some shape, certainly counted for much in its development.

What kind of taboo then is this which would forbid us, in our penury—our admitted penury—to draw upon the treasury of the

past? Is posterity to be denied the use of such and such forms and themes and methods just because it has not discovered them for itself? Would your correspondent impose this disability upon artists, sculptors, musicians, engineers? The notion is surely absurd. Why, then, should architecture be thus penalised and impoverished, unless in virtue of what I must still consider a prejudice or an obsession? Apologising for lengthiness,

W. RANDOLPH.

Clay Lump for House Building.

SIR,—Having recently had occasion to build an additional story over a century-old building constructed of clay lump, I am at a loss to understand why the use of this admirable and cheap substitute for brickwork continues to be neglected.

Some six years ago, when efforts were being made to revive the sound and economic building methods of our forefathers, and much attention was drawn to cob and pisé construction, letters from Mr. C. J. Skipper, Mr. Colin Bateman and others extolling the virtues of clay lump were published in *The Builder*, but they appear to have excited so little interest that public funds continue needlessly to be expended upon the building of dwellings with far more costly and less durable materials.

Clay lump, formerly in general use for the walls of dwellings in certain parts of Norfolk, where it is still occasionally thus employed, possesses for this purpose every virtue of brickwork except its appearance, and while offering greater protection from heat and cold, is readily obtainable in any district where the clay and straw of which it is composed are to be found.

The method of making the lumps is as follows, and involves no skilled labour or plant beyond a wooden box 18 in. by 9 in. by 6 in. without bottom or top; ordinary stiff clay is deposited on a piece of level ground, and, while being trodden by a horse, is brought to the consistency of putty by sprinkling it with water, during which process short lengths of straw, or other

fibrous material, are liberally added to the mixture, which is then moulded into blocks in the box mentioned above, and left to dry.

These blocks can then be laid as masonry by any able-bodied persons of ordinary intelligence, and require no mortar, but are bedded in the wet clay from which they are made, and can readily be cut by a saw to any required shape or size.

External walls of this material 9 in. in thickness are amply strong for two-storied buildings, and if their outer surface be protected from rain are everlasting. Clay lump is free from the objections which attend the employment of Cob or Pisé, both of which excellent materials depend for their stability upon the judgment and skill of those who handle them. They entail, moreover, an extravagant thickness of walls and take longer in building, which can only proceed during suitable weather; moreover, the occupation of cob or pisé buildings has to be postponed for some considerable time after they have been completed.

Those who contemplate the employment of clay lump should be prepared for discouragement from Trade Unions, whose policy is to obstruct building operations by unfettered labour, and from authorities opposed to all but late Victorian methods of construction. They may, however, rest assured that, should they succeed in overcoming such opposition, their buildings will shelter families in comfort generations after the steel and iron houses now in course of construction have found unlamented repose upon the scrap-heap.

JAMES RANSOME.

21, Suffolk-street, S.W.1.

Constantine Technical College.

SIR,—This award is open to little criticism, possibly none; but with a cornice overhanging 3 ft. 3 in. it will be necessary to top-light all the second floor rooms. Of what is that cornice constructed?

A. HENTHORN STOTT.

Manchester.

[** Other letters are held over until next week.—ED.]

Hortensia House, Chelsea.

MESSRS. PERCY TUBBS, SON, & DUNCAN, F. & AA.R.I.B.A., Architects.

EXTENSION TO THE SHIREHOUSE, NORWICH

THE Norfolk County Council recently invited designs for additions to the Shirehouse, Norwich, and appointed Mr. Godfrey Pinkerton, F.R.I.B.A., to advise them in the conduct of the competition, and to act as their assessor. His award was given in our last issue, and we illustrate this week the winning design, by Mr. A. Dunbar Smith, F.R.I.B.A. Mr. Dunbar Smith, who is the architect of several important works, including the Welsh National Museum with his late partner, Mr. Cecil Brewer, and recently the Newcastle Library, both won in competition, is at the present time engaged in carrying out extensive additions to the Fitzwilliam Museum, Cambridge. These are all important works of considerable architectural character, and the Norwich Council are to be congratulated on the result of the competition for their Shirehouse extension. The new building asked for was to comprise a semi-basement floor, with ground, first and second floors over. The semi-basement, to extend under the whole of the buildings and to contain detention cells, warders' rooms, accommodation for caretaker, boiler room, fuel and storage. The ground floor, devoted to the finance branch and local taxation branch, with access to the present Shirehouse from the new building, with a general and telephone office near the entrance. The first floor to be allocated to the County Surveyor's department. This department might be placed on either the ground or first floor, subject to the proviso that the County Department shall have a priority claim to be situated on the ground floor. The accommodation on the second floor was to be taken as following generally that of the first floor, except that in the event of the committee room, ante-room and convenience for women being placed on the first floor, their repetition on this floor would not be required.

It will easily be seen that the site was not a easy one to deal with. It is extremely limited on all sides by existing buildings on the south-west and north-east, and the Castle round at the rear, as well as the awkward approach towards the Castle Meadow-road. These limitations make it a difficult problem to get the site the large office accommodation asked for. The author of the selected design has overcome these difficulties and produced a compact plan and a well balanced façade of character towards the Castle Meadow-road and the Shirehouse. The grouping of the main entrance with its twin bays is a pleasing feature; the blank walls at the extreme ends of this frontage enhance the value of the central feature, as well as the return ends on the south-west, which are treated in a similar manner. As will be seen, the plan generally is simple and direct, all the rooms are of a good shape, and the type of access—so essential in a building of this size.

The circular hall is well lighted and pleasing, with its main staircase facing the entrance. Generally, the elevations are dignified and treated with a reticence which in no way competes with the surrounding buildings, and they are eminently suited to such a City as Norwich, which is so full of historic buildings. In execution it may be found desirable to make some minor alterations in the plan to secure better lighting to the accountant's department facing the Prince of Wales'-road. The architect, in the course of his report, states:—

"In order to make the fullest use of the site, the front of the building follows closely its old outline, except that the end nearest the Shirehouse is kept far enough back to leave a space between the boundary railings and the caretaker's quarters. This arrangement too, gives a larger area at the back. The accommodation for the County Accountant's Department has been placed on the ground floor as desired, with a separate entrance internally for the local Taxation Branch. A doorway at the foot of a short flight of steps at the south-east end

of the ground floor corridor, gives access to the door into the Shirehouse. A few steps, opposite the prisoners' passage to court, lead down to the detention cells. The circular hall is top lit with balconies carried round on the upper floors. In order to save space, the corridors have not been run through and as they are quite short, they would be fairly well lit from the hall, while ample borrowed light can be provided. The committee room has been placed at the back, away from the street noises and the windows to the principal officials' rooms have also been kept away from the main front, but double casement windows can be provided quite easily.

The materials used externally would conform with those of the present Shirehouse, the walls being faced with thin, handmade, sandfaced bricks, with Ancaster stone dressings and the roof covered with Delabole, or slates laid in graduated courses. The windows would be of lead glazing and the external doors of oak. Internally, the floors would be of ferro concrete, or hollow brick construction supported on steel framing and all internal walls above the ground floor, except those surrounding the staircase and circular hall being 3 in. partition blocks, thereby gaining floor area and adding to the flexibility of the plan, as it would be comparatively easy to move a partition if required. It is proposed that the main staircase and the floors of the entrance and circular hall should be of travertine, or Hopton Wood stone, and that the walls in hall, up to 7 ft. high, should be finished in the same material, which would also be carried up the stairs to the first floor as a dado. The floors of corridors to be of rubuleum with travertine margins and the walls of Keene's cement.

The floors of detention cells would be of terrazzo, those in the caretaker's quarters and storerooms of wood block and the remainder of granolithic. The heating would be by radiators placed under the windows, with fresh air inlets behind; also in recesses in corridors and elsewhere where required."

It is thought that the building could be very well built for 2s. 9d. per foot, which brings the total cost to £45,885.

BRISTOL CATHEDRAL

ONE of the most interesting items in the renovation carried out during the last two years at the Cathedral, has been that of the "Berkeley" Chapel.

Although closely associated in many ways with the Berkeley family, it is in Newland's Chronicle referred to as "the Vestry" and it formed part of Abbot Knowles' great work of rebuilding the Eastern arm of the Church at the end of the thirteenth and beginning of the fourteenth century. The date of its completion may be approximately fixed in the early years of the fourteenth century. Lady Joan Berkeley, wife of Thomas Lord Berkeley, was buried in 1309 "in the arch between the vestry and the South aisle": her husband was buried in the same tomb in 1321. The beautiful little Sacristy through which the Chapel is approached from the South aisle of the Presbytery, with its skeleton vaulting and much elaborate detail, is perhaps contemporary with the chapel, although the windows in the South wall appear later, and may be insertions. The Chapel is about 26 ft. in length and 17 ft. 6 in. in breadth, vaulted in two bays with two 3-light windows on the East side and one large one of 4 lights on the South. An altar stood in each eastern recess and there are still traces of frescoes in the southern one. Piscinae and aumbries are in the N.E. and South walls, in the centre of the North side is the Berkeley tomb already referred to, and in the South-west angle a stair-turret leading to a room over the vaulting, and the leads.

On the removal of the unsightly tile paving dating from about 1860, the original floor level was discovered eighteen inches below, with the remains of a stone seat on the West, North, and South sides. This has been restored on the old lines, adding much to the beautiful proportions

of the Chapel. There is a shallow step down from the South aisle to the Sacristy, and with the five steps from the Sacristy to the Chapel, the floor level of the latter is about 3 ft. below that of the South aisle of the Church. In addition to the restoration of the stone seat, two simply-treated stone reredoses have been set up in the eastern recesses, with oak altar tables in front of them, raised on two steps above the floor of the chapel. York stone has been used for both Sacristy and Chapel, some Pennant of a slightly darker grey being introduced on the altar platforms: the steps are of Portland stone, and the reredoses of Monk's Park Bath stone. Each altar has a cross and two candlesticks in silver. Electric light is supplied by four pendants, and the heating by three radiators, one behind each reredos, and a third on the cill of the South window.

Between the altar platforms and in spaces between them and the stone seats, a number of ancient encaustic paving tiles, found during the progress of the work, have been laid: unfortunately much of this ancient tiling was found to have been broken up and mixed with the concrete supporting the modern tiling of the last century, the fragments being too small to re-use. The unsightly modern glazing has been removed and figures of St. Christopher, and St. Anne teaching the Virgin placed in the centre lights of the windows on the East side: in the large window on the South side are four scenes in the childhood of Christ, the intention being that the Chapels shall be used by the children of the Diocese. They have been designed and executed by Mr. A. W. Robinson and Mr. Board (Messrs. Joseph Bell & Son of Bristol) who have also provided the altar crosses and candlesticks from the architect's designs.

The general works of restoring the Chapel, and the provision of the prayer desks are by Messrs. Wm. Cowlin & Son, Ltd., of Bristol, the two altar tables by Mr. W. H. Saunders of Cirencester, the heating by Messrs. Haden & Sons, Ltd. of Trowbridge, the electric lighting by the Colston Electrical Company of Bristol, all under the personal superintendence of the architect Mr. Roland Paul, F.S.A.

We illustrate this week the work by two photographs of the interior (by Mr. F. Bromhead of Clifton) and smaller views of the exterior and a ground plan. Measured drawings of the Sacristy were published in the *BUILDER*, August 8th, 1885, and a general view of the Cathedral in which the "Berkeley" Chapel is prominent in the foreground, in the *BUILDER* Cathedral Series, August 1st, 1891, both from drawings by the architect of the present work.

Excavations near Cissbury Ring.

Excavations on Park Brow, to the north-east of Cissbury Ring, which was lately acquired by the National Trust, has resulted in the discovery of remains of villages of the bronze and iron ages. Included among the discoveries are Roman tiles, Roman tile nails, fragments of walls with coloured distemper, Roman glass, and many remains of pottery.

Waterloo Bridge.

In a letter to the *Times*, Mr. Arthur Keen points out that "in addition to the five who made separate reports showing that underpinning the old bridge was both possible, safe, and economical, there were fourteen more who studied the matter exhaustively and made a joint report to the same effect which was embodied in the main report to the L.C.C. They went farther and dealt with the question of the quality of the granite and produced actual tests which show that there is not the slightest ground for saying that the granite is unreliable. Further, there were three more engineers of wide experience who endorsed all the nine "conclusions" of the fourteen who signed the report—twenty-two altogether. The simple fact appears to be that to strengthen the foundations of a massive structure like Waterloo Bridge is a matter of every-day practice and can be done by any one of the three or four or more methods."

LIFTING A TOWN

BY J. HEMBROW.

Those of us who have been much abroad, particularly in our Colonies, will have been accustomed to the sight of a wooden church or meeting room, or a small house being calmly towed along the street by a tractor, from its original site to a new one; but few would believe that much more wonderful things than this have been done in this country, where the buildings are not of studs and weather-board, but of substantial brick and stone.

The town of Northwich, in the salt district of Cheshire, owing to the continual pumping of brine, steadily sinks, and periodically has to be lifted! The last occasion was only recently, when the writer was connected with some work there. The streets themselves at some points were raised six feet, and the work of lifting affected buildings proceeded almost without intermission, and is still proceeding.

The "Bull Ring," or what is really the central part of the town, had then sunk so nearly to the level of the river that frequent flooding occurred and worse was feared, and the bridge (a moving one) was so close to the water that it was becoming impossible to carry on with the ordinary work of the stream. It was, therefore, decided to raise the "Bull Ring" six feet odd, and the affected portions of the town proportionately. A photograph shows the "Bull Ring" before the work was begun. It is rather sad that the old building shown has had to go. The authorities determined the new levels of the main streets, and this level was marked on each of the building fronts.

The problem of raising a building is an old one in this town, and certain of the houses are constructed with a view to being raised later. Others have been prepared for the ordeal by having a steel or heavy timber base frame introduced, on which they are supported when lifted. Some buildings have to be prepared, and some, of course, at times are found unsuitable altogether and have to make way for new. Under the new regulations I believe all buildings have now to be of steel or timber-framing of such a kind as to allow of their being raised in the future.

The actual work of raising is done by manual hydraulic jacks, which are placed in suitable positions under the steel or wooden bases, and the buildings raised gradually. Each of the jacks is worked co-ordinately with others to ensure that the building being raised is lifted in a perfectly regular and even manner. Any carelessness or accident in this might cause torsion, which would mean at least that the windows would be broken, and perhaps rendered useless; doors would become immovable owing to the alteration of the shape of the opening; plaster or tile work would be cracked, or even a serious accident might result. When it is remembered that

business is carried on in most of the buildings during the whole time this work is going on, it will be realised how delicately the raising is performed. People are being served at the shop counters, and are sitting having tea, while the whole of the building, perhaps several stories high, is being bodily lifted, the occu-

Shop Below Level of Roadway.

pants with it. Of course, the process is slow—perhaps 1½ in. to 3 in. per day.

Each time the limit of the thrust of the jack is reached the building is supported on timber packing, the jack itself packed up or built, and the lifting renewed.

Through long experience the contractors

understand this packing so well that, as the writer knows, no accident has occurred. Many people must have felt a tender towards panic to find a building weighing scores or hundreds of tons dizzily perched on the top of what look to the observer to be crazy piles of wood, but what are, in reality, very carefully constructed supports. The building shown, with half-timbered upper story, always give one this sensation. The ground floor here was unsuitable to the purpose for which the place was to be used, after the upper portion had been raised, seen in the photograph, the whole of the lower portion of the building was removed and another one substituted.

Where buildings are found to be unsuitable for lifting or are not worth the expense involved, the first floor is used as the ground floor, and the second floor or attic, as the case may be, takes its place. The old ground floor becomes a cellar, but is usually filled in on account of the nearness of the river level. One sometimes goes up a wooden staircase to a particular shop and down stairs to the shop next door. As the raising is raised the number of steps up to the high shop is decreased, and the low level shop increased or abandoned, and it is quite possible to enter a shop by means of a short ladder like a staircase to-day and in a week to walk straight into the same shop the road level or go down a ladder. One may also well lose a shop altogether, and find it is now so much below the new street level that it has been abandoned, and that the proprietors are pursuing their trade in some other building.

The effect of the settlement is wide, and appears to be felt most in the portion of the district near the bridge. It does not, of course, only affect the buildings and streets themselves; all the gas mains, water mains and particularly the sewers, are interfered with by the slow settlement. At the time these notes refer to, they were all being replaced. The old sewers are abandoned, and new drains laid at suitable levels in the new position. The roads are raised by piling hundred tons of coke breeze and other hard core on top of the old road, the new surface being when time for consolidation has been allowed.

All this causes great expense, and a special tax on the brine-pumping companies to cover the work, which is held to be caused by their activities, is called for by the Council and used locally. When any work to be performed on a building is undertaken the need for which has arisen out of the sinking of its site, the Council counts for the work done are submitted with a claim to the brine pumpers, who, so far as they deem their responsibility goes.

Anyone motoring through the town at any time within recent years must, if possessed of a keen sense of humour, have been amused at some of the quaintnesses caused by

Dane Bridge.

lowly and unequally sinking streets. On the first occasion the writer visited it, it gave the impression of one of those drawings which set out to portray how the intemperate reveller sees a street at three o'clock in the morning. The buildings, as one approaches the affected part, seem to be at all angles and all levels.

The one item out of the many that impressed the writer most during the street work was probably a very trivial one—it was the rather tall lamp standard at the Bull Ring corner. This is a very high and aloof lamp-post indeed, but week by week the rising road swallowed more and more of its lofty dignity, and when last seen before being raised it appeared to endanger the headgear of the good-natured policemen on duty under it. It gave me the eerie sensation of a town sinking out of sight; the cinders of the new road might have been the volcanic cinders which enveloped Pompeii. One had a vision of some dimly distant archaeologist excavating through strata after strata of a town, and saying, "What race of moral giants was this which planted its feet upon a shifting stance and refused to yield or leave?"

RAMSGATE LAY-OUT COMPETITION

THE competition open to landscape architects and surveyors recently promoted by the Borough of Ramsgate for the lay-out of approximately 60 acres of agricultural land, chiefly as a sports centre, has been won by Major R. Hardy-Syms, F.S.I., M.T.P.I., of 3, Gray's Inn-place, London, W.C.I., to whom the prize of £100 will be awarded. We publish the winning lay-out design, together with a plan showing the contours of the land at 5 ft. intervals (see p. 317).

The principal problem was to solve the method of treatment of the rights of way crossing the land, and competitors were required to prepare alternative schemes (a) showing the

rights of way undisturbed; and (b) with the rights of way diverted in a specified manner, together with advice as to the advantages in having the said roads diverted.

The selected design advocates the preservation of the rights of way as there are several practical and economic disadvantages attendant upon any re-arrangement. The main vehicular approach to the ground is from the Ramsgate Margate road on the north east at the "Hare and Hounds," Northwood, by an existing narrow lane to the level crossing over the Southern Railway at Jackey Baker's Farm House. Mr. Hardy-Syms' report draws attention to the inadequacy of this approach, and certain road widenings are suggested, and in order to deal successfully with the increase in

traffic to be expected a motor park with garages and bicycle sheds is provided at the farm to the east of the railway.

The whole of the educational facilities, which include boys and girls' school, playgrounds, playing fields, and school gardens, are kept on the east side of the railway so that few children will have to cross it. To the west of the railway the major portion of the land is laid out for sports with certain portions on the south as allotments.

The sports facilities provided for are:—

Summer Sports.—A first-class cricket ground some 5 acres in extent, together with four permanent cricket creases between the football and hockey pitches, kept fenced off during winter, for less important matches; while second and third rate creases can be provided where it is not possible permanently to protect creases. The dotted circles indicate the normal field of play of cricket, and there is ample space outside these circles for practice nets.

Eight hard courts and seven grass courts for tennis.

Two bowling greens.

The running and cycling track is five-eighths of a mile in length and 15 ft. wide. The existence of this track is useful in introducing an element of regularity into the plan.

These facilities provide for a simultaneous playing population of approximately 300.

Winter Games.—Eight football pitches of international size. The firm lines indicate the positions of these areas. The four principal pitches are arranged south of the right of way in the area defined by the running track.

Any of the football pitches can be utilised for hockey, though the hockey pitch is, of course, smaller. This, with the hard tennis courts and running track in addition, would allow a winter playing population of some 250.

Buildings.—Football and cricket pavilions and tea rooms are designed for and recommended to be in reinforced concrete. The other accessory buildings suggested, *i.e.*, tennis and bowling pavilions, spectators' shelters in positions for viewing the games, or sports on the track at a distance from the main pavilions, groundsmen's workshop, sports equipment stores, tool sheds on the allotments, &c., are designed for and recommended to be of steel frame and concrete construction.

Tree Planting and Landscaping.—The whole of the boundaries are planted with quick growing protection trees. The general effect to be aimed at is a broad one of green sward backed by trees and the sky. A little ornamental "gardening" should be done at the tea rooms, but otherwise, if the tree planting is done with the practical idea of obtaining wind screens and the demarcation of boundaries, as in the case of the isolated trees and clumps in the permanent cricket ground, the general effect will look after itself.

Showing a Northwich subsidence of olden days.

Extension to the Shirehouse, Norwich.

We illustrate Mr. A. Dunbar Smith's design for this building. A large number of designs were submitted, Mr. Godfrey Pinkerton, F.R.I.B.A., being the assessor.

Oak Tree School, Dorking.

This is a mixed Home School, also designed to accommodate about fifty day boarders. The peculiar plan is dictated by the importance of securing S.E. and S.W. aspects for all the rooms, the corridors occupying the N.W. and N.E. sides of the wings, which radiate from the Central Hall.

Messrs. Seth-Smith & Monro are the architects and Mr. R. Mansell, of Croydon, the general contractor. Heating and hot water by Messrs. Comyn Ching & Co.; electric light by Messrs. Tamplin & Makovsky; steel casement by Messrs. Williams & Williams.

Hortensia House, for the Chelsea Borough Council.

The scheme, which was started under the Addison Housing Act, is situated in Hortensia-road, Chelsea, on a site of approximately 1½ acres. It consists of 56 flats in three blocks, arranged to form a kind of a courtyard. The accommodation is as follows:—

In the larger flats there is a living room, three

bedrooms, scullery-kitchen, larder and bathroom containing a w.c., and a combined bath and lavatory basin, an open lobby and large cupboard and coal store. The smaller flats have one less bedroom. No range has been provided in the living room, but a gas cooker is installed in the scullery. The scullery is fitted with a gas heated copper and an enclosed dresser. Hot water is supplied from a central boiler under the middle block, which supplies bath, sink and lavatory basin in each flat. The hot water scheme was designed by Mr. Walter Nobbs, and is on the gravity system, no artificial acceleration being provided. Each room is wired for electric light, and a "current limiter" is fitted to each flat. This device is much used in the East, but it has not yet come into general use in this country. The idea is that each flat is allowed to use so many candle power only at any one time. If more light than this is used, all the lights flicker until one or more are turned out, to bring the total candle power down to that allowed.

This system obviates the expense of providing separate meters in each flat.

The buildings are faced with hand-made, sand faced, multi-coloured bricks, laid with a fluted joint, except the back of the main block, which is of stocks with grey hand-made bricks for the staircase towers and the plinth; the roofs are covered with hand-made tiles. The cornice and the surrounds of the entrance doors are made of artificial stone. The stairs are of concrete and the floors of light hollow tiles, constructed to take a load of 86 lb. per square foot. The passage and the floors of the kitchens and bathrooms are of jointless flooring, but the living room floors are of boards nailed to breeze concrete. The walls of the staircase are finished in cement rendering and painted, the dado being blue with bright yellow above; the walls of the flats are distempered.

The roads are constructed of patent reinforced concrete blocks, but the roads taking light traffic are of tar-macadam. There are four independent pram-stores so placed that they complete the central courtyard. Under the central block next to the boiler room is a common drying room.

The contract was entered into in July, 1924, and amounted to £42,000, but it is anticipated that considerable economies will be effected so that the scheme will cost slightly under 1s. per foot cube, including the roads and boundary walls.

The architects for the scheme are Messrs. Percy Tubbs, Son, & Duncan, F.R.I.B.A., and the contractors:—General contractors, Messrs. William Moss & Sons, Ltd., London and Loughborough; hollow tile floor ditto; bricks, Messrs. Thomas Lawrenson, Bracknell, Berks; tiles, Messrs. William Brown, Redhill, Surrey; artificial stone, Messrs. Malec MacCloud & Co., Ltd., London; central heating water system, Messrs. G. N. Haden & Sons, Ltd., London; electric installation, Messrs. Ozon Ltd., London; jointless flooring, Messrs. Burkenite, Ltd., London; roads, Spagnoli Grunspan, London; paint, Hadfields, "Heolite" hardware, Nettlefolds, London.

Tudor Fireplace Revealed.

The removing of some panelling at Welleslands, Tenterden, Kent, revealed a well-served Tudor fireplace composed of Bethers marble. It is 7 ft. high, 8½ ft. wide, weighs nearly a ton.

ART TREASURES IN SOVIET RUSSIA*

By HUNTLY CARTER.

NOWADAYS the fashion is to explore Soviet Russia in search of oases instead of ruins. A year ago Sir Martin Conway, Professor of Art and Director of the War Museum, returned from a visit to Russia with a fairly large oasis in his pocket. Its nature and value now appears in a book which tells us that the author's "sole concern in Russia was the works of art, and especially those that had been in public possession or the property of the Tsars before the revolution. There were also the private collections, the palaces and great houses, the cathedrals and monasteries and their treasures, as to the fate of which the English public, at any rate, was entirely uninformed." He adds some startling figures which convey an idea of what Russia contains in the way of "treasures." All the places he visited were packed with works of art. There were "70,000 pieces of plate" waiting for accommodation, and vast collections of all sorts including "upwards of 20,000 pictures," and "10,000 objects of gold."

Though the author is at great pains to make it known that he was concerned with works of art as such to the exclusion of all else, there is plenty of evidence in his book to show that his mind was busy with the social meaning, value, and consequences of the nationalization of private property, or expropriation, as socialists call it. "The wholesale Russian confiscation proved to me how little the public gains by this vast multiplication of individual losses" (p. 29). But though he seems to deplore this gathering together of fine things for the pleasure of the general public, elsewhere he shows that the Royal family occupied palaces containing superb collections of works of art from which no one derived benefit. "But far more interesting than the State apartments are the rooms in which the Tsars actually lived. . . . They possessed endless treasures of matchless beauty and rarity. . . . They could have hung their living-rooms with pictures by Raphael or Rembrandt. . . . What they actually did was to hunt out some

* "Art Treasures in Soviet Russia." By Sir Martin Conway. Illustrated. (Arnold.) Price 16s.

obscure set of small rooms in some remote corner of a huge building and to furnish them in the simplest, least tasteful, and most bourgeois style of their day" (p. 111). Then follows a description of a set of apartments of the size and atmosphere of that of a small Bloomsbury boarding-house "in which Nicholas I lived, worked and apparently ate." In an interesting chapter on "Confiscated Houses," the author describes the new use to which private houses containing valuable collections of works of art have been put. The most important private palaces in Petersburg (now Leningrad)—he insists on retaining the old name—with their contents, were protected, and have now been turned into museums" (p. 136). The owners are permitted to remain and to become caretakers. One expropriated landlord was set to work to turn a large house into a toy museum for children. The result was a great success. "Children come by hundreds and he shows them round." They call him "Uncle Museum." "Life for him at any rate is still full of interest."

Sir Martin devotes a great deal of space to a description of the confiscated treasures. There is no doubt that he was impressed favourably, even enthusiastically, not only with their extreme beauty and extraordinary abundance, but with the respect shown by the Russians for their inheritance and the care taken to preserve and restore them. But mixed with his pleasing sensations there is, perhaps inevitably, a note of regret that these things were turned over for the use of the people in the way they were. It is a pity that he has taken advantage of his peculiar position of an art lover let loose, as it were, to inspect and enjoy at leisure, with expert assistance, world-famous pictures and other works of art contained in palaces, houses, churches and monasteries, to make endless notes of everything, or so it seems, that he saw. True, he remarks that there were great heaps of things at which he could not do more than merely glance. As a result of this method he has unloaded a mass of bare statements of fact which makes his book look like a hastily com-

pleted inventory. A far better method would have been to concentrate on some of the great masterpieces such as those the Hermitage contains, and to call attention to the general mass of pictures, icons, plate, etc., which have been preserved. For instance, the palace of the Hermitage to-day contains some of the greatest pictures in the world. In my opinion it is superior to the Prado at Milan, the Louvre, the Hague, and it makes the National Gallery look like a dealer's assortment of fakes and false attributions. It takes about four hours merely to walk through it. If one were to stop and carefully examine each object in it, this would take five years—if one's eyes lasted.

This hustled method of doing any one side of Russia to-day is apt to cause important omissions. It is so in Sir Martin's case. He omits facts that are worth knowing, and entirely avoids showing the relation of historical Russia to contemporary Russia. In his chapter on the History of Russian Art he commences with Byzantine influences of the tenth century, but says nothing about the Tartar influences of the eleventh century.

These two influences may be traced in present-day architecture, costume, theatrical decoration, public ceremonies, and so on. Indeed, the proletarian style and æsthetic is a mixture of pre-Peter the Great style and that suggested by modern scientific industrialism. The new worker's blouse is cut on Greek lines, the new Army uniform goes back 1,000 years or more. The shape of the helmet is similar to the shape of "The Helmet of the Son of John the Terrible," illustrated on p. 86. Likewise in architecture, like the Kazan station, there is a return to the pure Russian style, if such exists. At any rate, it is a break-away from German and French influences. Sir Martin traces a French influence in palace and domestic architecture, but not a German one. Indeed, there is very little said about architecture, although Moscow, like Reval and Prague, is a museum of architectural styles. One would have welcomed a chapter on the Kremlin architecture with its fine specimens of Byzantine style and developments therefrom, together with an account of the restoration work which has been carried on with great success since 1917. He glances briefly at Lenin's tomb and notes its Egyptian

Lenin's Tomb.

style. Perhaps it would be more correct to say Egyptian crowned with a Greek sarco-phagus. Much more could be said about this structure, seeing that it is a symbol of New Russia and largely determined by the intentions of the Government and the needs of the new population. In designing it the architect was faced with three problems—political, social and civic propaganda—a building that credits Lenin with being the founder of the Soviet State and a symbol of Soviet power; one that satisfies a public sentiment of hero-worship; and one that adorns and harmonises with the surroundings. As an embellishment it cannot be said to be a success. It certainly does not harmonise with the Chinese battle-mented wall and the Renaissance building in the background. It was designed by M. Alexander Schoussev, the leader of the revivalists, and designer of the imposing Kazan station at Moscow. It should be said it is only a trial design and its present purpose is to exhibit the embalmed body of Lenin.

Kazan station is said to be a pure Russian style, but I doubt whether there is a pure Russian style. In any case, Russian forms of art are of Mi-Byzantine and Mi-Tartar origins, as illustrated by the vaudeville entertainment called Chauve-Souris, now going the round of the European theatres. The new theatrical ceremonies of State—pageants, parades, mass performances—have a relation to the historical Russia with which Sir Martin is concerned. But he does not appear to have noticed anything of the kind.

There are certain points not mentioned which, I think, go to the credit of the Government. The author refers to the superb works of art in the monasteries and churches. Some of these places are being turned into museums. The Russian cathedrals and churches are more richly endowed with works of art than even the Italian ones. The book contains many descriptions of their amazing beauty. But how many lovers of art can inspect these treasures while people have and exercise the right of praying in these places of worship at all hours of the day as well as Sundays? In my experience of Russian chapels there is a continual stream of people kissing icons. Churches, of course, are intended for worship. I do not know whether they ought to be hiding-places for priceless works of art.

Sir Martin has practically nothing to say about the new standards of culture and the new æsthetic which have emerged during the seven years' struggle for a new form of society. It is true he has a chapter on Modern Russian Painting, which serves to illustrate his admission that he knows little or nothing about the new symbols and forms which are rapidly harmonising with or replacing the old ones. There is in Moscow a large room full of significant models of rationalistic forms of architecture designed by proletarian architects. There is the Russian theatre with which I deal in my book, "The New Theatre of Soviet Russia." This theatre is an outcome of the working-class society, and is inextricably bound up with the memory and aspiration of that society. The author describes his visit to the Little Theatre at Moscow where not only did he have the uncommon experience of "a woman of the people" slipping into his box and occupying the best seat uninvited, but he saw scenery of which he could make nothing. Against it the actors appeared giants. What he saw was a new scenic principle at work. By being placed against dwarf scenery actors appear gigantic in size. The effect experienced was "that the drama was lifted above the level of everyday life and put on an heroic plane" (p. 240).

On the whole, however, this survey of art treasures in Soviet Russia is important and interesting from start to finish. It is written in a spirit of tolerance, and will probably produce a demand by art-lovers and connoisseurs for visas which the Soviet Government may find embarrassing. It contains eighteen illustrations of "treasures" reproduced on art paper.

UNIVERSITY COLLEGE SCHOOL OF ARCHITECTURE

THAT the art of building is one of the most complicated there is no doubt. That a modern architect must be well trained and have an encyclopædic knowledge of other different sciences, such as engineering, electricity, hygiene, sociology, economics, archæology, etc., which are closely associated to architecture, is a necessity *sine non que*. It is therefore well understood that a practitioner worthy of the name of architect cannot very well acquire by himself, as before, the necessary knowledge to enable him to carry successfully an art which modern requirements render more and more difficult. Not a long time ago an architect was acquiring his experience at the expense of his client: that is to say, at the risk of offending the public. Nowadays numerous schools have been founded aiming to provide the would-be architect with sufficient ammunition to start the fight fully equipped.

The London University School of Architecture is one of the oldest established schools in the country. Since the year 1848, which saw its birth, numerous improvements following step by step the progress of modern science have been introduced, thus providing the student with every facility. Having its seat in University College, and in close touch with other departments of this College, mainly the Slade School, the Faculty of Engineering and the Faculty of Art, which deals with literature, history and archæology, the School of Architecture in its course of five years gives the maximum efficiency in the shortest time. Upon entering the School, the freshman in his first year is acquainted with the handling of instruments and how to use them properly, special attention being given to the draughtsmanship and value of colour in composition. The teaching of architecture to a freshman is a very delicate thing. He is taught the first basis of architecture, from examples taken in the past; but the teaching must be in such a way as not to choke any future personality that the student may develop. Drawings of the three orders, one of which must be a measured drawing usually taken from the court in the British Museum, and small and easy designs illustrating these orders, are the first architectural steps of the student. Conjointly, the freshman follows lectures on history, presentation, elementary design and mainly construction, with weekly exercises under the personal supervision of the lecturer in building construction. A course of decoration under a special master is also included in this year. Mr. Lovett's (first year degree student) Greek compositions and Museum studies have particularly satisfied the R.I.B.A. examiners.

The second year is devoted to the study of domestic architecture, and for the first two terms a design of this type of architecture has to be carried out to a complete stage of working drawings, including half-inch and full-sized, thus acquainting the student with office routine. Colour decoration, freehand drawing, history and building construction are the other main subjects included in this year. In the exhibition of the work of the School, held at University College last July, one noticed with satisfaction Mr. Light's design and excellent working drawings for a farmhouse. Students in the third year have different design problems to solve in the traditional manner, as it seems logical that they should first acquire the knowledge of the past and have a solid ground which will enable them little by little to free themselves from traditionalism, if they wish, later on, in the last year of their studies. The R.I.B.A. examiners for the certificate delivered at the end of the third year were particularly satisfied with Mr. Dyer's and Mr. Summerton's beautiful designs for a College chapel, and they congratulated Mr. Cochrane, whose general

standard in draughtsmanship and design received special comment. The subject set out in this year are varied, and in the last exhibition many good designs of an architectural library, a bathing establishment, a factory (with working drawings comprising steel calculations), etc., were noticeable.

In the fourth year, students have already more liberty of taste in the designs they have to set out. These are of a more difficult order and range from a geological institute and a reinforced concrete warehouse to a block of flats. The latter problem has given some very interesting solutions, and many good plans, where lighting, ventilation, circulations, and all considerations of hygiene, comfort and interior artistic treatment were well considered. Miss Jessie Gray's and Mr. Alicott's designs for a block of flats have particularly satisfied the R.I.B.A. examiners, who awarded them first mentions.

Students in the fifth year have to enter an office, thus still maintaining the traditional way of pupilage education. In the night they follow courses of advanced design in the atelier. Mr. Connell exhibited some remarkable designs, expressed in a modern way, which denoted the good taste and thorough knowledge of classical architecture of the author. Mr. Stokes showed great skill in sketch-designs, and Mr. Short and Mr. Alabaster exhibited designs which showed that their authors are not easily satisfied.

In their fifth year students take courses of town planning, professional practice, theory of design, etc.

SCHOOL PROSPECTUS

West Ham Municipal College.

WE have received a copy of the prospectus of the West Ham Municipal College for the session 1925-1926, which includes the programme of the architectural and building crafts departments. The college does not profess to do more than instil into its pupils a rudimentary knowledge of architecture, which is taught in conjunction with the other forms of art, and for which a collective certificate is awarded. There is a two-hour lecture and some simple exercises in design each Wednesday evening, which are intended to give preliminary training to those studying architecture as a profession. In addition to this Mr. W. H. Ansell, M.C. F.R.I.B.A., A.R.E., will lecture every Tuesday evening on "Architecture in the Making."

The building trades are dealt with more fully. Course M.1 instructs a beginner in practical mathematics for builders and gives an elementary knowledge of building construction. Course M.2 is more advanced, dealing with materials and graphics; and Course M.3 includes planning and design and buildings, use of modern materials, information relating to building Acts, and by-laws, and building quantities. Courses N.1 and N.2 deal extensively with plumbing and sanitary science and actual practice in the workshop.

Mr. T. C. Baillie, M.A., D.Sc., is the principal of the college; Messrs. F. Gould Wil F.R.I.B.A., and C. T. Bloodworth, B.A. and A.R.I.B.A., lecture on building construction. Mr. H. Warren, A.R.San.Inst., A.R.I.B.A., lectures on sanitary science; and Mr. W. H. Thurstone, A.R.San.Inst., R.P., M.V.O.P.A., instructs in plumbing class. This session commences on September 16.

Southchurch Hall, Southend.

Southchurch Hall, with five acres of ground surrounding it, has been given to Southend Corporation by the family of the late Mr. Dowsett, first Mayor of the town. The conditions are that the ground shall be preserved an open space, and the Hall used as a museum or some other similar purpose.

LEGAL SECTION.

NOTES ON CURRENT CASES

Rent Restriction and Flats Rateable Value.

The case *Barrett and Evans v. Hardy Brothers (Alnwick), Ltd.*, which we were able to note only very briefly in our issue May 22, is now reported in the Law Reports (1925, K.B. 220), and as it raised an entirely new point and by apportioning the rateable value of a building in Pall Mall brought a flat rented at £200 per annum within the Rent Acts, it requires further consideration.

The tenants of a second floor flat in Pall Mall had applied to the County Court for the apportionment, not of the rent, but of the rateable value, and the Divisional Court, constituted of two Lords Justices of Appeal, Lord Justice Bankes and Lord Justice Scrutton, decided this was the first case to come before them which raised the point as to apportioning the rateable value.

The facts were that on August 17, 1917, the tenants had let to the plaintiff, Mr. Barrett, a flat on the second floor for a term of five years from September 29 at a yearly rent of £55 for the first three years, and £200 for the last two years. On October 11, 1922, this period having expired the defendants let the same flat to Mr. Barrett, the other plaintiff, on a quarterly tenancy from September 29, 1922, at a rent of £53 15s. a quarter. The application to apportion the rateable value was made under section 12, subsection (3), of the Rent Act, 1920.

Before August, 1917, the floor in question had been let as business premises at an annual rent of £150. The floor had never been separately rated, and on August 3, 1914, the basement and first floor were assessed together at £375 gross and £313 rateable, the second, third, fourth, and fifth floors being assessed together at £240 gross and £200 rateable. At a later date these floors had been assessed together at £240 gross and £200 net, the shop and the first floor at £650 gross and £592 net, and the basement at £450 gross and £375 net. The County Court judge had apportioned the rateable value of the flat at £60, and the Divisional Court, which although constituted of two Lords Justices of Appeal, only possessed the powers of a Divisional Court, has felt constrained by previous decisions to uphold the apportionment although the date from which apportionment had to be assessed was varied, but this made no difference as the rateable values remained the same from August, 1914, to the date of the letting in question, August, 1917.

The surprising effects of the decision cannot, however, be gathered from expressions used in the judgments of the two Lords Justices; Lord Justice Bankes is reported as saying that the effect of the decisions which had been directed at stopping obvious holes in the Act through which a landlord might escape, had been to create a chasm in which even a house in Pall Mall became engulfed, and Lord Justice Scrutton is reported as saying, "That these premises should be within the Rent Restriction Acts seems at first sight absurd. The rent of this flat has not since March, 1914, been more than £150 per annum, the superior limit for rent restricted houses in London having never been more than £105. At present under the 1920 assessment the whole building is rated at £1,100 gross, £967 net, the part which comprises this flat, apparently three floors, being valued at £450 gross, £375 net. The language of the Rent Restriction Acts makes it very difficult to say what the legal position is."

Even in the light of the judgments now delivered it is almost impossible to see clearly the matter stands. The finding of the court may be summarised in the words of Lord Justice Bankes, who, after citing *Woodhead v. Samuel* (1920, 89 L.J. (K.B.) 689;

The Builder, February 27, 1920); *Sinclair v. Powell* (1922, 1 K.B. 393; *The Builder*, April 28, 1922); *Woodhead v. Putnam* (1923, 1 K.B. 252; *The Builder*, December 8, 1922); *Marchbank v. Campbell* (1923, 1 K.B. 245, *The Builder*, December 8, 1922); *Rex v. Judge of Marylebone County Court* (1923, 1 K.B. 365, *The Builder*, February 23, 1923); *Sutton v. Begley* (1923, 2 K.B. 694; *The Builder*, June 6, 1924), and *Joy v. Eppner* (1925, 1 K.B. 362; *The Builder*, January 2, 1925), said "The result of these decisions undoubtedly is, to use Mr. Justice Salter's language in *Woodhead v. Putnam*, that to entitle a tenant to apportionment under section 12, subsection (3), it is not necessary that the property in which the applicant's dwelling house is comprised should itself be a dwelling house or should be subject to the Act."

The question was, is the apportionment only applicable where the whole house is within the Act as was the case in *Woodward v. Samuels (ubi sup)*, or is it applicable where as in *Sinclair v. Powell (ubi sup)* (or where as in this case Lord Justice Scrutton says was the case in *Sutton v. Begley (ubi sup)*), the whole house is not within the Act?

On the above cases the Court held in the case under consideration that the latter is the case as regards the rental and also (this being the first case as to apportionment of rateable value) as regards rateable value.

Now *Lelyveld v. Peppercorn* (1924, 2 K.B. 638; *The Builder*, June 27, 1924) would appear to be an authority to the contrary, because in that case, where parts of a house had been let separately before August, 1914, but in 1922 rooms differently grouped were let to the applicant for apportionment, it was held, the only standard rent applicable was the rent at which these rooms were let in 1922; but the Divisional Court in the case under consideration intimated that that case did not apply, and it might be a question whether the decision was consistent with the earlier decisions cited above.

This case raises such very important questions and embraces properties of such value that having stated what the finding of the court was, we venture in the abstract to analyse the statute; but before leaving the case as decided, we may point out that the court held that there was no question as to apportionment of rent here, as the premises were first let as a dwelling-house in 1917 at a rental of £185, and therefore, to quote Lord Justice Scrutton: "No question of apportionment of rent, therefore, arises; and as far as rent is concerned, this flat is not a dwelling-house to which the Act applies."

That is to say, it being known that the rent of the part of the house let as a separate dwelling exceeded the rental limits laid down in the Act no apportionment could be asked for; but the rateable value as regards that portion being unknown, an inquiry can be instituted as to its amount even although it is known that the rateable value of the house as a whole exceeds the limits prescribed in the Act, on the same principle that has been applied where rent is in question.

Lord Justice Bankes dates the origin of this difficulty from the decision delivered by the Court of Appeal (to which he was party) in *Sinclair v. Powell (ubi sup)*. There the house as a whole was not within the Rent Acts then in force, and the Divisional Court held, this being the case, when parts were let off in flats the standard rent of each flat would be that at which it was first let. The Court of Appeal upheld this finding, but on another ground, that there had been such a reconstruction of the house as to make it lose its identity. Lord Justice Scrutton, who was a member of the

Court, however, dissented, and adopted the view taken by the Divisional Court. Lord Justice Bankes, in the case under consideration, admitted that it would have been better had the majority of the Court at that time adopted the view taken by the Divisional Court and supported by Lord Justice Scrutton. In *Barrett's* case Lord Justice Scrutton criticised section 12, subsection (3), as follows: "The statutory authority for apportionment is to be found, if at all, in section 12, subsection (3), of the Act of 1920. This begins: 'Where for the purposes of determining the standard rent or rateable value of any dwelling-house to which this Act applies. . . .' As whether a house is within the Act depends on whether its standard rent or rateable value exceeds a certain limit, this section literally read runs round in a useless circle. If you have not determined these items, there is no proof that the Act applies to it. It is said that you must read the words as if they said, 'Where in order to determine the standard rent or rateable value of any dwelling-house for the purpose of seeing whether this Act applies to it, it is necessary to apportion,' &c. The words obviously do not say that in their ordinary meaning. The definitions do not help the matter. . . ." The definitions do not help the definitions of standard rent and rateable value contained in section 12 subsection (1) (a) and (e).

Lord Justice Bankes said: "A construction of the subsection" (3) "has been established which reads 'standard rent' in a sense other than the sense in which it is defined by the Act, and gives to the expression 'dwelling-house' to which this Act applies 'not the full sense of a dwelling-house the rent or rateable value of which is within the statutory limit, but merely the sense of being a house or part of a house let as a separate dwelling.'"

The decision even in the opinion of the Court itself has had such unexpected results—Lord Justice Bankes is reported as saying that the result of the decisions had been to give opportunities to unscrupulous tenants to evade quite legitimate obligations—that it is clear the matter must be altered either by a decision in a case carried to the House of Lords, or failing that by legislation.

It is to be noted that in the above observations we have quoted no mention is made of subsection (2) of section 12, which precedes the subsection (3) which was under consideration. By this subsection the Act is to apply "to a house, or part of a house let as a separate dwelling, where either the annual amount of the standard rent or the rateable value does not exceed" the limits prescribed, "and every such house or part of a house shall be deemed to be a dwelling-house to which this Act applies." Then subsection (3) provides "where for the purpose of determining the standard rent or rateable value of any dwelling-house to which this Act applies it is necessary to apportion the rent at the date in relation to which the standard rent is to be fixed, or the rateable value of the property in which that dwelling-house is comprised, the county court may on application by either party make such an apportionment as seems just. . . ."

It seems almost impertinent even to suggest a reading of these subsections which may obviate the present difficulty, but apart from the decided cases it would appear that a logical reading of the Act would be as follows:—Subsection (2) defines the scope of the Act it applies to a house, or part of a house let as a separate dwelling, but this is disjunctive as neither the whole house nor part of the house to be within the Act must exceed the limits of rental or rateable value laid down. If the whole house is within those limits, then if part of it is let as a separate dwelling, to ascertain the standard rent or the rateable

value "it is necessary," as subsection (3) says, to apportion the rent as on August 3, 1914, or the rateable value "of the property in which that dwelling-house" (let separately) "is comprised," but if the whole house exceeds the limits prescribed, that house as a whole is outside the Act altogether, it has not to be considered at all, but the part let separately may be a dwelling-house by itself within the Act, in which case its standard rent will be the rent at which it was first let separately.

The rateable value raises a question of greater difficulty in adopting this reading because not only may that not be determined at the date of the separate letting, but the Act in subsection (3) specially mentions "the rateable value of the property in which that dwelling-house" i.e., a dwelling-house to which the Act applies "is comprised." In this connection there is a curious difference between the definition of "standard rent" and "rateable value." The definition of standard rent only refers to the dwelling-house as such. "The expression 'standard rent' means the rent at which the dwelling-house was let on August 3, 1914, or where the dwelling-house was not let on that date, the rent at which it was last let before that date, or in the case of a dwelling-house first let after the said August 3 the rent at which it was first let."

Rateable value is defined: "The expression 'rateable value' means the rateable value on August 3, 1914, or in the case of a dwelling-house or a part of a dwelling-house first assessed after that date the rateable value at which it was first assessed." The introduction of the words "or part of a dwelling-house" in this connection are significant. Do they imply that if a part of a house steps into the Act as a separate dwelling it must be separately rated? There appears to be an omission and uncertainty in the Act in this respect, but the judgments delivered in the case we are considering show the dangers of the Courts supplying omissions. It appears to be conceded that the Legislature never intended houses to be brought within the Acts by reference to assessments made on houses outside the Acts, which has been the effect of the decided cases, and a remedial measure appears urgently to be required.

WORKMEN'S COMPENSATION

As we have shown in our note on two cases which were decided in the House of Lords, *Glasgow Iron and Steel Co. v. Dickson and Coltness Iron Company v. Dagleish* (*The Builder*, August 7), there has been some difficulty in ascertaining the effect of the provisions of the Workmen's Compensation Act, 1923, where the accident causing the injury has occurred before the date on which that Act came into force, January 1, 1924.

Another point of this description arose in two cases, *Briggs v. Thomas Dryden & Son* and *Talbot v. Vickers, Ltd.* (*Weekly Notes*, June 30), before the Court of Appeal. We only set out the facts in the first of these two cases, as the same principle was involved in both cases. The applicant, then a lad of about seventeen years of age, on April 4, 1918, had met with an accident arising out of and in the course of his employment, through which he had lost the greater part of his forefinger. He received compensation, 10s. a week, until September 13, 1918, when he resumed work, but on November 6 a declaration of liability was filed. The applicant attained the age of twenty-one on December 7, 1923. On September 29, 1924, he underwent an operation to remove the stump of the finger and was totally incapacitated until January 13, 1925. During this period of incapacity he was paid compensation at the rate of 17s. 6d. a week, this being the 10s. plus the War Additions. The applicant in these proceedings was applying for a review, and an increase of the compensa-

tion as from the date of the operation to 35s., under the First Schedule of the Act of 1906, para. 16, which provides: "Provided that where the workman was at the date of the accident under twenty-one years of age, and the review takes place more than twelve months after the accident, the amount of the weekly payment may be increased to any amount not exceeding 50 per cent. of the weekly sum which the workman would probably have been earning at the date of the review if he had remained uninjured, but not in any case exceeding £1." These latter words are modified by the War Additions Acts.

The Act of 1923 has repealed this proviso in paragraph 16 of the Act of 1920 and substituted the following proviso for it in section 24, subsection (6): "Provided that, where the workman was at the date of the accident under twenty-one years of age, and the review takes place more than six months after the accident and before the age of twenty-one years, the amount of the weekly payment may be increased to such an amount as would have been awarded if the workman had at the time of the accident been earning the weekly sum which he would probably have been earning at the date of the review if he had remained uninjured."

It will be seen this new proviso had no application to the case in question, because the workman had attained twenty-one years before the review took place, and it had been contended, therefore, that the workman had no right to the increased benefit either under the new Act or the repealed provision in the Act of 1920. The Court of Appeal held that as the result of the declaration of liability the workman had an accrued right to have his compensation fixed on review by reference to the provisions contained in Schedule I, para. 16, of the Act of 1920, a right which was preserved by section 38, subsection (2) (e), of the Interpretation Act, 1889, which provides: "Where this Act, or any Act passed after the commencement of this Act, repeals any other enactment, then, unless the contrary intention appears, the appeal shall not affect any right, privilege, obligation or liability acquired, accrued or incurred under any enactment so repealed," and no "contrary intention" appeared in section 24, subsection (6), of the Act of 1923.

This is an extremely important point to bear in mind in connection with the provisions of the Workmen's Compensation Act, 1923, for many of the provisions contained in that Act are expressly not made to apply where the accident happened before the commencement of that Act. Thus by section 30 it is provided that the provisions contained in sections 2 to 10 are not to apply in such circumstances. In such cases, therefore, it may be taken that far from a "contrary intention being expressed" that the repealed sections shall not apply to cases excluded from the new Act, there is an implication they still apply, for it was never intended to leave workmen without remedy either under one Act or the other. It will be remembered that a Divisional Court in the case of *Clemmens Aluminium Co.* (*The Builder*, December 12, 1924) gave a similar interpretation in regard to another provision of the Act as has now been given by the Court of Appeal in the case we have been considering.

Scott Memorial, Devonport.

The National Memorial to Captain R. F. Scott and his four companions, who died on the return journey from the South Pole in February-March, 1912, was unveiled at Devonport recently. The monument has been erected on Mount Wise, and overlooks Plymouth Sound. It is in the form of a granite pylon surmounted by a bronze group representing Courage, sustained by Patriotism, spurning Fear, Despair, and Death. The figure Courage is being crowned by Immortality. The memorial was designed by the late Mr. Albert H. Hodge, R.B.S.

THE RATING AND ASSESSMENT BILL

THE Rating and Assessment Bill makes slow progress in Committee, but at the resuming sitting recently the Minister of Health expressed the firm intention of the Government to carry it through. Opposition in Committee to any Bill does not in itself indicate much, as may be the result of opposition by a small party, but there are indications that this Bill not favoured by large sections of the community and a large amount of Parliamentary time being expended on a measure which, if called for at all, is certainly not deemed one of the most pressing reforms to be hurried on.

At the recent meeting of the representatives Assessment Committees and Rating Authorities for England and Wales, dissent from the Bill was strongly expressed, and there are few bodies which are prepared to recommend it as it stands as a whole. At the sitting of the Committee on Tuesday the Minister withdrew clause 10, which relates to the rating of owners and the collection of rates by them, but on apparently that there might be more opportunity of considering suggestions that the Government has received from local authorities since the Bill was introduced, as this clause did not appear in the "draft Bill," and had not therefore received the same amount of criticism or suggestion as clauses submitted in the draft Bill.

Clause 11, which deals with rating of houses let out in parts was also withdrawn, but on the Minister stated, to re-appear in Part II of the Bill. This clause was also not in the draft Bill. Clause 15, the first clause in Part II, was also reached. This clause appeared in the Draft Bill, but there have been certain alterations in it since it was submitted in that form. It deals with "valuation areas and authorities and subclauses (1) and (2) are as in the draft where the clause was numbered 11.

To an amendment proposing that no rating area should be in more than one valuation area the Minister said that there was nothing in the Bill which would make any change in five-sixths of the present areas and the Bill was only a step towards further legislation which would be directed to the reform of the Poor Law; which connection it would be proposed that the functions of the Boards of Guardians should be transferred to other local authorities, and it was desired to avoid duplication and re-duplication of local authorities and to avoid elections where the issue would turn solely on the amount of relief. The question of large boroughs of 50,000 population and upwards was discussed, it being pointed out that these might be county boroughs but for the fact that such applications had been suspended pending the report of the Royal Commission on Local Government, and so promise of consideration was given and amendment was withdrawn.

The only amendment carried, or conceded, in this clause appears to have been in sub-clause 5 which was in the "draft Bill" the time was altered from three to six months within which, if the council of any county wished to submit a scheme after such period, permission is given to the Minister to make the scheme himself.

The principal difference in this clause from what it stood in the draft Bill occurs in sub-clause (4), which has been redrafted as follows: "No scheme submitted to the Minister under section shall be of effect unless and until approved by the Minister." After these words the draft Bill provided, "and the Minister approve a scheme with or without modifications"; but in the present Bill the clause continues "and the Minister after considering any representations with respect to the scheme which may be submitted to him by the rating authorities (which representations rating authorities are hereby authorised to make) may approve the scheme with or without modifications."

Clause 16, which was numbered clause 12 in the draft Bill, is in much the same terms as in

Bill with the exception of subclause (5), reads: "There shall be included among members of every assessment committee persons who are Commissioners for the local purposes of the Income Tax acting for the division which, or some part of which, is comprised in the valuation area, and the said members shall be appointed in the case of a valuation area constituted by a joint scheme in any manner as may be provided by the scheme, or in any other case by the Council of the borough or the council of the county as may be."

The Committee the principal discussion ranged on subclause (3), which provides: "In the case of a valuation area being a county borough, an assessment committee shall, subject to the provisions of this section, consist of such number of persons to be appointed by the Council of the borough as may be determined by the council, and the council shall appoint an assessment committee such number of members, not being in any case less than one-fifth of the total number of the members of the committee, as they think fit, to represent the boards of guardians of any unions any part of which are comprised in the area of the valuation area, and the persons so appointed to represent the boards of guardians shall be persons nominated by the boards." The proceedings of the committee have not been very clearly reported in the press, for although it is stated that Sir Kingsley Wood, on behalf of the Government, accepted an amendment moved by Mr. Sandeman Allen, in terms of that amendment have not been reported, but from the context we gather that the representatives of Labour desired all members appointed to be members of the boards of guardians the amendment in question provided that 20 per cent. should be appointed from the boards of the Councils and guardians.

A further amendment, moved by Mr. Rye, in terms that no member of the assessment committee should be a member of the valuation committee, was adopted, which he said had been adopted by the Westminster City Council, was also accepted on behalf of the Government. At the conclusion of the Committee, only sixteen amendments had been considered out of the seventy-five comprised in the Bill, and there are 400 pages of amendments still to be considered.

WAR MEMORIALS.

The Nicholson Memorial, Leek.

The Nicholson Memorial clock tower at Leek was unveiled recently. The architects were Messrs. Thomas Worthington & Sons, Manchester.

Eccles War Memorial.

The Eccles War Memorial, erected at Eccles, Lancashire, recently unveiled at Leek, is a memorial to the men of that town who died in the war. It was designed by Mr. John Birrell, of Manchester, and stands in a commanding position near the Town Hall. It consists of a pyramid of Portland stone 24 ft. high, surmounted by a bronze figure 4 ft. high symbolizing "Peace." On the column is an inscription and a panel representing a soldier's reversed arms.

Earl Kitchener Monument.

The Earl Kitchener Monument, which has been erected on the rocky western coast of the mainland of Anglesey, near the spot where Earl Kitchener was killed in the "Hampshire," has been completed, and will be unveiled next month.

Heywood War Memorial.

The Heywood War Memorial, erected at a cost of £1,000, was unveiled recently. It is a horizontal mass of granite in the form of a sarcophagus, on the sides of which are four wreaths.

Shipyards War Memorial.

The Shipyards War Memorial and hall, erected at Wallsend, is a memorial to the directors, staff, and employees of Swan Hunter, Wigham Richardson & Co., shipbuilders, to the memory of 216 employees who fell in the war, were unveiled recently. The hall and memorial have cost £15,000.

ARCHITECTS' & BUILDERS' INQUIRY BUREAU

We are glad to give questions and answers, but cannot accept responsibility for contributed replies, especially on legal matters.

May we appeal to our correspondents to submit their queries on paper of a size easily filed, and written as legibly as possible, or, better still, in typewriting!—ED.

Dry Rot.

SIR,—Can any of your readers suggest a cure for or preventive of dry rot. I am continually having to lay new floors on my ground floor, fungus forming every few days. It is not for want of ventilation as air bricks were placed all round the house, and the joists are at least 2 ft. from the ground.

"ANXIOUS."

A Boundary Wall Question.

SIR,—I shall be glad to have your ruling on the following point. "A" built a boundary wall before the war, "B" has just built a house adjoining. According to the titles the wall is mutual and consequently "B" is bound to pay "A" for half the cost of the wall. In making up "A's" claim, should pre-war or present-day rates be taken?

J.

Well Under House.

[REPLY TO WATER, AUGUST 21.]

SIR,—With reference to this question, one should take accurate account of the amount of water drawn over a dry period for the purpose of cooking and washing, and on the maximum that the household would use. This would then prove whether the rain-water could be dispensed with, because the supply would be equal to the greatest demand and taken at the very worst time for record.

G. W. HARRIS.

"Reduced White Lead."

[ANSWER TO "PIGMENT," AUGUST 14.]

SIR,—This term means ordinary hydrocarbonate white lead to which has been added a proportion of sulphate of barium (usually in the form of natural barytes) or other "reducers." This pigment cannot be properly termed an adulterant when its presence is indicated by the use of the word "reduced," and if used in a moderate proportion, say, up to 8 or 10 per cent., is certainly not detrimental to the durability of the paint, because barytes is quite inert and is not affected by alkali or acid. Its defect, however, is lack of "body" or opacity—in other words, it is semi-transparent when made into paint. I have had natural barytes ground in oil and applied on wood in as many as eight coats without the knots and grain being hidden. Genuine lead paint has, of course, excellent body, and it is because of this that a small percentage of barytes can be added without much disadvantage. Some 25 years ago a great deal of adulterated white lead was sold as "pure" or, to use the correct trade term, as "genuine." To put a stop to this objectionable practice, the White Lead Corroders Section of the London Chamber of Commerce appointed an inspector, who prosecuted in many cases where analysis proved adulteration, and insisted upon the use of the word "reduced" in all cases where any substance was added to the white lead. These prosecutions have almost wholly done away with the practice of selling the adulterated lead as pure, and purchasers may now be reasonably certain of obtaining genuine white lead when the package is so marked. Unfortunately, the actual proportion of barytes or other "reducer" used in reduced white lead is not uniform, and it would be a good thing for all concerned if it were. Formerly packages of reduced white lead were sold as No. 1, No. 2, No. 3, &c., the object being to indicate to some extent the reduction or relative amount of barytes added, No. 1 having less than No. 2, but this practice has also been stopped. I cannot understand your correspondent's remark that "it (reduced white lead) appears to be considerably more expensive than the ordinary type." It should be cheaper, as barytes costs considerably less than white lead.

ARTHUR S. JENNINGS.

Cleaning Porcelain Enamel Baths.

[REPLY TO R. P. B., AUGUST 14.]

SIR,—Your correspondent will find that petrol makes an excellent solvent for the greasy dirt that collects on the side of a bath or lavatory basin, and it has the advantage of containing nothing of a gritty or scratchy nature that will damage the enamel.

AUTO.

Shuttering.

[REPLY TO "R. M. P.," AUGUST 21.]

SIR,—In reply to R. M. P., I have had good results from mixing soft-soap and lime in equal quantities, both, of course, diluted with water to the consistency of cream, and then put on the shuttering with a distemper brush.

G. W. HARRIS.

Red Ash Tennis Court.

[REPLY TO NORTH COUNTRY READERS, AUGUST 14.]

SIR,—The best surface for a hard court is undoubtedly asphaltic limestone, supplied by several well-known merchants ready for laying, and it is applied in three layers of reducing gauge from 1 in. down to dust, each layer being well rolled in. For a cheaper surface I can think of no better medium than the ashes from a brick kiln. Though I do not know of any hard court made of this material, I have recently examined some of it from a neighbouring brickfield and have seen paths made of it where it has become well bound together and of an excellent surface. The ashes are partly ashes from the coal and partly well-baked clay dust, and the two ingredients seem to "marry" well. I am intending to lay a court of this material and shall simply roll two 1 in. layers of this dust on a good, well-levelled foundation such as your correspondents mention.

EXPERIMENT.

Wind-driven Electric Lighting Plant.

[REPLY TO MR. P. EDWIN STEPHENS, AUGUST 14.]

SIR,—I should strongly advise against a wind-driven electric lighting plant. Wind is such a fickle means of power that the extent of the storage batteries will cost a figure which will represent an annual outlay far in excess of that expended upon fuel for an internal combustion engine. It is actually found that except in the most favourable cases the latter type of power will beat the water-driven plant for economy, and after all, water, if worth the choosing at all, is far more constant than wind.

PETROL.

Preserving Post-ends.

[REPLY TO MR. T. BURTON, AUGUST 21.]

SIR,—A very good method, specially for oak or other hard wood, is thoroughly to char (burn partially) the stump of post, or the part buried in the earth or concrete, as the case may be. This is a good method of preserving.

G. W. HARRIS.

Sand-lime Bricks.

[REPLY TO MR. CHARLES ANDERTON, A.R.I.B.A., AUGUST 14.]

SIR,—I would refer your correspondent to the Government pamphlet upon the subject of sand-lime bricks, published by H.M. Stationery Office, where very complete information will be found. The sand-lime brick is merely a lime-concrete brick, and it is extremely doubtful if it can compete with the ordinary burnt clay brick for price. Actually, of course, lime is a manufactured article, while clay is a raw material, so that the sand-lime brick starts with a disadvantage in a free and open market.

BRICKS.

B.T.U.

[REPLY TO "CERCHER," AUGUST 14.]

SIR,—A British Thermal Unit is the amount of heat required to raise 1 lb. of water through a temperature of 1 deg. Fahr.

TROUVER.

THE BUILDING TRADE

HINTS TO BUILDERS

By J. H. BARNES, F.I.O.B.

APPROXIMATE ESTIMATES (contd.)

Following on the approximate cost of a window a door will be dealt with on similar lines.

External door about 3 ft. by 7 ft. opening.

	£	s.	d.
18 ft. 4 in. by 3 in. deal door frame at 1s. 2d.	1	1	0
19 ft. sup. 2 in. deal door at 3s.	2	17	0
Hinges, lock, &c.	12	0	
Painting, say 6½ yards at 2s. 6d.	16	3	
Arch and lintol, say	8	0	
Threshold	12	0	
	£6	6	3

Deduct.	£	s.	d.
21 ft. sup. 1½ brick wall	2	9	0
21 ft. sup. red facings and pointing at 8d.	14	0	
21 ft. sup. plastering at 2s. 4d. yard	5	5	
Distempering, &c.	1	9	
	£2	16	1

Thus it would seem that the extra cost of an external door over and above the cost of the wall would be about £2 16s. If an imported door were used the cost would be about 25s. less.

The cost of internal partitions per yard could be approximated as follows:—

Slab partitions plastered and distempered complete.	s.	d.
1 yd. sup. 2 in. slab partition	4	6
2 yd. sup. plastering (both sides measured) at 2s. 4d.	4	8
2 yd. sup. distempering (both sides measured) at 9d. per yard sup.	1	6
	10	8

The cost of partition slabs will depend upon the kind specified. If doors are required in these slab partitions the extra cost of these over and above the cost of the partition mentioned above could be arrived at as follows: Cost of internal door, say 3 ft. by 7 ft. opening in slab partition.

	£	s.	d.
18 ft. run 3 in. by 3 in. door frame at 11d.	16	6	
19 ft. sup. 1½ in. deal four panel square framed door, at 2s. 6d.	2	7	6
Hinges, lock, &c.	12	0	
Painting as before	16	3	
Lintol, &c.	2	6	
38 ft. architrave	15	0	

Cost of door £5 9 9

Deduct.	s.	d.
21 ft. sup. 2 in. slab partition at 4s. 6d.	10	6
4½ yd. plastering (both sides measured) at 2s. 4d.	11	1
4½ yd. distempering (both sides measured) at 9d.	3	7
6 ft. run skirting painted, at 10d.	5	0
	1	10 2

Extra cost of Internal Door . . . £3 19 7
If an imported door were used the cost would be about 25s. less.

Roofs.

The approximate cost of a yard super of roofing could be arrived at as follows:—

	s.	d.
Say—2 ft. cube fir in rafters (6 in. by 2 in.)	11	0
9 ft. sup. batten for slating	6	
9 ft. sup. slating (plus, say, 10 per cent. for cuttings), sq. 80/-	8	0
Say, per yd.	19	6

If with 1 in. boarding fixed to rafters under slating battens, add 40s. per square, or 3s. 4d. per yd. If underside of rafters lathed, plastered and distempered, add 4s. 8d. per yd. To the above must be added the cost of roof trusses, purlins, or similar supports to roofing.

APPROXIMATE AND COMPARATIVE COSTS OF FLAT ROOFS PER YARD SUPER.

For Lead Flat.

	£	s.	d.
2 ft. cube fir in joists, &c. (say, 6 in. by 2 in.), 5s. 6d.	11	0	
1 yd. sup. 1 in. boarding	3	8	
1 yd. sup. 5 lb. lead and labour to flat with additional measure for rolls, &c., say, ½ cwt. (82s. cwt.)	2	1	0
3 ft. run deal roll	1	6	

Per yard £2 17 2

For Zinc Flat.

	s.	d.
2 ft. cube fir in joists, &c. (5s. 6d.)	11	0
1 yd. sup. 1 in. boarding	3	8
1 yd. sup. 12 gauge zinc and labour to flat, with additional measure for rolls, &c., say	7	0
3 ft. deal roll	1	6

Per yd. £1 3 2

For Asphaltic Flat on Boarding, &c.

	£	s.	d.
2 ft. cube fir in joists, &c. (5s. 6d.)	11	0	
1 yd. super 1 in. boarding	3	8	
1 yd. super ¾ in. asphaltic in two thicknesses (6s. 3d.), and wire mesh (1s.)	7	3	

Per yd. £1 1 11

Each form of flat roofing will require some kind of skirting, the cost of which should be added to the prices mentioned above. The joists and boarding to carry flats are taken to be the same size for each kind of covering, so that the comparative cost of each can readily be seen, but it should be remembered that in practice the bearers to flat should be calculated in accordance with the span of the flat, &c. It will be observed that the small detailed labours have not been measured, and it is presumed that the prices quoted should cover these.

The advantage of preparing approximate estimates by the square or yard is that it is a simple matter to form a schedule of prices for any straightforward work, and the prices so decided upon are capable of easy revision in the not infrequent event of a change in prices of labour or materials, and no great labour would be involved in keeping your approximate prices up to date, whereas in the case of estimating for buildings by the cubic foot, any small variation in the detail prices would be a somewhat difficult matter to adjust.

A grave objection to preparing estimates for buildings by the cubic foot is that the persons using the prices may after a time forget the basic rate of wages and materials upon which the price was originally founded and thus tend to make the approximate price still less to be relied on.

Cost per Unit of Accommodation.

When an estimate has been prepared for a building it may be necessary to put the figures before the proposed building owners or clients in a form of "cost of per unit of accommodation." This is sometimes done in the case of Hospitals, to show the cost "per bed" and the cost so stated should mention whether the price quoted includes for administration or other block or whether the prices for these are rated separately. Similarly for theatres and such buildings, it is not unusual to be asked for the cost per seat.

A simple method is to divide the cost of the proposed building by the proposed seating accommodation and thus obtain the price per seat. Of course, these figures, would not include the furniture or theatrical fitter.

Repetition in Building Work.

It is not unusual in the case of repetition for the customer to ask if a builder is willing to erect a similar building at the same price per cubic foot as the one he may have just completed, as if it is possible to adjust the figures of lines the customer would save his own cost. The Bills of Quantities required for the preparation of the estimate. Where the premises are exactly identical the method suggested very well be adopted, but it is hardly likely that two buildings would be exactly alike in details of size and site and general construction and any considerable difference in the construction of the building might affect the cost per cubic foot. For instance, if the proposed building is slightly smaller than the building which is to be taken as the basis of comparison, the smaller building might require almost as much labour and material to do the work as the larger building, but they would be spread over a smaller number of cubic feet, and therefore the price per cubic foot may be higher.

On the other hand, if the proposed building were larger than the building which it is proposed to take as a basis, the increased size may require a more expensive system of construction, as stronger girders, thicker walls, &c., and the price per cubic foot may be higher than the one it is desired to take as a basis. In such considerations go to show that it is very unsafe for the builder only to accept comparisons which are based on an estimate prepared from Bills of Quantities measured by a method in the orthodox way.

TRADE NEWS

We have received this quarter's issue of *Shepherd's N.E.W.S.*, published by W. Shepherd & Sons, Ltd., Rochdale. This compact magazine should be of value to all architects, builders as well as actual road contractors. It contains short, pithy and practical articles by authorities on all subjects dealing with the building trade. In this number there are several contributions of interest.

Messrs. Everseal Products, Ltd., of New Works, Goldsmith-street, London, W.C.2, inform us that Messrs. Major & Co., Ltd., have called their attention to the fact that the "Preservol" has been already registered by themselves. In future, therefore, the seal product of that name will be known as Omniseal. The firm ask us to express regret that they should have inadvertently used a name already in use.

Institute of Builders.

The following candidates successfully elected to the Institute of Builders Licentiate examination in May, 1925:—

Messrs. J. M. Atkinson (Leeds); Barnard (Merstham); A. W. Birch (York); W. N. Birch (York); H. C. V. Brown (London); J. E. Cox (London); J. L. I. (Glasgow); R. Eggleton (London); W. Wood (St. Helens); J. S. Groves (London); T. E. Hall (Newton-le-Willows); M. C. (Ilford); T. H. Howard (St. Helens); Laycock (Keighley); W. H. Lee (London); L. V. Luton (Honours in Book-keeping (London); H. A. Maxfield (Waltham Cross); I. E. Meredith (Birmingham); J. A. (St. Helens); C. W. Moore (London); Peacock (London); H. Roberts (Thames Heath); W. A. Y. Sandow (London); Smith (Cardiff); A. Stevenson (Wales); R. D. Teague (Cardiff); M. Ton (Leeds); C. M. Turton (Barnsley); Wheatley (Thornton Heath).

NEW BUILDINGS IN LONDON.

Gate.—A contract has been placed with The Pitcher Construction Co., Ltd., 57, Burton-grove, N.7, for the rebuilding of the on and buildings on the Metropolitan Rail-line. The architect is Mr. C. W. Clarke, r-street Station, W.1.

erton-street.—The new garage, repair and petrol service station will accommodate 350 cars. Work has just started on the by Messrs. F. & H. F. Higgs, Ltd., Herne S.E. The plans have been prepared by s. Edmund Wimperis & Simpson, .B.A., 61, South Molton-street, W.1.

king.—Messrs. Staddon, Ltd., drapers, are ve further extensions made to their business ises in Balham-street. The contractors are s. Harris & Wardrop, 10, Wallwood-street, . The plans have been prepared by s. T. Jay Evans & Son, 1, Newton-street, .

tersea.—Factory premises in Elcho-street, d by Messrs. Aplin & Barrett, and Western ies Creameries, Ltd., are to be extended. architect is Mr. Edgar S. Underwood, .B.A., 3, Queen-street, E.C.4.

esford-square.—Upon the completion of inter season it is expected that the Beres-square Cinema will be closed for extensive rs and improvements. Plans, which in an enlargement of the hall's capacity, have prepared by Mr. Bertie Crewe, 75, Shaftes-avenue, W.1.

shopgate.—The Anglo-American Oil Co., 36, Queen Anne's Gate, S.W.1, have led to build an extensive petrol storage and ce depot in Bishopsgate, E.C.3, and have uded negotiations with the L.C.C. for the ase of a site in Norton Folgate, E.C.3.

ckingham Palace-road.—Excavation of the or foundations for the new "King's Head" c-house is now being carried out by the actors, Messrs. Prestige & Co., Ltd., 149, enor-road, S.W.1. Plans have been pre-l by Messrs. Petch & Fermand, 12, Buck-ingham Palace-road, S.W.1, acting for Messrs. ey, Combe, Reid & Co., Ltd., the owners.

sh Hill Park.—The Edmonton E.C. have ed to build an elementary school, including ties for manual and cookery classes, bly hall, &c., Plans have been prepared Messrs. Talbot Brown & Fisher, Burystead-, Wellingborough.

amberwell.—The L.C.C. have passed plans, nted by Camberwell Productions, Ltd., for tions and additions to the Camberwell re, S.E., including the remodelling of the ing and extension on an adjoining site. have been prepared by Mr. Clifford Aish, edford-street, W.C.2.

herine-street.—Alterations and additions be made to the premises at Nos. 25-27, rine-street, S.W.1, on behalf of the owner, . Barlow. Plans have been prepared by s. Boddy & Dempster, 19, Falace-street,

pton.—Extensions are to be made to the of Messrs. The International Chemical Co., whose factories are in Oxhill-street, E.

london.—The Westminster Bank, Ltd., pro- to build a branch bank on a site at the of The Avenue and Brighton-road. Mr. ddock Perkin, F.R.I.B.A., 25, Alkham- N.16, is the architect.

london.—A large number of houses are to it by Messrs. H. Bacon & Son, Chipstead- ouldson, at a cost estimated at £44,918.

don.—Work is shortly to be put in hand on construction of a new telephone exchange. have been prepared by H.M. Office of , Storey's Gate, S.W.

nton.—Messrs. E. Rodgers & Son, 3, -road, Islington, N.1, have in hand the g of three shops with flat accommodation at Nos. 157, 159, and 161, Fore-street, N.,

the site having been sold by Messrs. Waite & Waite. Plans have been prepared by Mr. W. A. Lewis, A.R.I.B.A., 11, Finsbury-square, E.C.2.

Finsbury-square.—Work has now started on the site at the corner of Finsbury-square and Wilson-street, E.C., where a large block of offices is to be erected for the Maypole Dairy Co., Ltd. The contractors are Messrs. Prestige & Co., Ltd., 149, Grosvenor-road, S.W.1. The plans have been prepared by Mr. W. A. Lewis, A.R.I.B.A., 11-12, Finsbury-square, E.C.2.

Greenwich.—A large site at Maze Hill, Wool- wich, S.E., has been acquired by the governors of the Roan School for Boys, Greenwich, for the building of three proposed new scholastic institu- tions. Estimated to cost £63,000, the new building will accommodate 500 boys and has been designed by Sir Banister Fletcher, F.R.I.B.A., 1, King's Bench Walk, E.C.4.

Holloway-road.—The L.C.C. have decided to make a grant of £21,500 towards the cost, esti- mated at £73,000, of extending the Northern Polytechnic in Holloway-road, N.7. It has been decided to put the work in hand forthwith. The additions, divided into three separate schemes, have been planned by Messrs. T. P. Bennett & Son, 41, Bedford-row, W.C.

Islington.—Alterations and additions are to be made to the premises at the St. Mary's Parish Schools in Andover-row, Hornsey-road, N. Plans have been prepared by Mr. E. J. Harrison, Lic.R.I.B.A., 23, Berkeley-road, Crouch End, N.8.

Kensington.—It was stated in our issue for July 31 that Messrs. J. Greenham, Ltd., of Isleworth, are the builders for the new offices and showrooms for Messrs. John Baker & Co., but we are informed this is an error, as the firm are doing the demolition and excavation work.

Leyton.—A new school to accommodate 300 children is to be erected at Sybourn-street, Leyton, at a cost of £10,000. The contractors are Messrs. F. J. Coxhead, 45, Bulwer-road, E.11, the plans being prepared by Messrs. Newman & Jacques, 61, West Ham-lane, E.13.

Moorgate.—The large corner premises at Moorgate and Lothbury, E.C.2, have been pur- chased by the Caledonian Insurance Co., Ltd., 81, Coleman-street, E.C.2, and a complete recon- struction, including a new story, is proposed. Plans have been prepared by Messrs. A. M. Blomfield & Driver, Grocers' Hall, Princes- street, E.C.2, and the work will be carried out by Messrs. Howell J. Williams, Ltd., 11, Bermondsey-street, S.E.1.

Mortlake.—A new garage is to be erected for Mr. C. A. Benoke, 165, Lower Richmond- road, S.W.14, to plans prepared by Mr. R. B. Rowell, A.R.I.B.A., 5, The Triangle, Upper Richmond-road, S.W. The steelwork will be supplied by Messrs. T. C. Jones & Co., Ltd., 95, Wood-lane, W.12.

Nelson-street.—An application is to be made to the licensing bench for sanction to plans providing for the rebuilding of the "Lord Nelson" public house. Plans have been prepared by Mr. M. T. Saunders, architect to Messrs. Watney, Combe, Reid & Co., Ltd., West- minster.

Oxford-street.—A new building to be used as shops and offices is to be erected on the site at the corner of Oxford-street and Duke-street, W.1. The contractors, Messrs. Higgs & Hill, Ltd., Crown Works, South Lambeth-road, S.W.8, are engaged on the excavation works. The agents are Messrs. Garrett, White & Poland, 17, Hanover-street, W.1.

Poplar.—The Poplar Lending and Reference Library is to be extended at a cost of about £3,500. The contractor is Mr. W. Simms, 137, Brook-street, Stepney.

Regent-street.—Under the direction of H.M. Office of Woods and Forests 112, Regent-street, owned by the Goldsmiths' & Silversmiths' Co., is to be rebuilt. Plans are being prepared by Messrs. North, Robin & Wilsdon, F.R.I.B.A., 35-39, Maddox-street, W.1.

St. Marylebone.—On the large site bounded by St. John's Wood-road, Maida Vale, Aberdeen-

place and Northwick-terrace, W., blocks of self- contained flats are to be erected. Plans are being prepared by the Central London Building Co., Ltd., 24, Grove End-road, N.W.8, who will carry out the building work.

Tottenham.—The plans now approved for the development of the White Hart estate provide for the erection of 346 houses and nine shops. The architect is Mr. G. Topham Forrest, F.R.I.B.A., County Hall, S.E.1.

Tottenham.—New slipper baths are to be erected at the rear of the old Fire Station in Conway-road, N.15, which itself is also to be considerably altered. The contractors are Messrs. H. Knight & Sons, 16, Bruce-grove, N.17.

Tottenham.—An extension is to be erected at the factory at Leswin-place, N.16, owned by Messrs. Price & Co. (Bakers), Ltd., Brixton, S.E.5. Plans have been prepared by Mr. M. W. Hudson, 9, Northumberland-avenue, E.8.

Victoria Park.—Alterations and improvements costing about £12,000, are to be made to the "Morpeth Castle" public house, for Messrs. Truman, Hanbury, Buxton & Co., Ltd. The contractor is Mr. H. V. Clogg, 81, Vallance- road, E.1. The plans have been prepared by Mr. A. E. Sewell, the brewery company's archi- tect, and the quantities by Mr. W. Gilbert, 74, Broad-street-avenue, E.C.2.

Westminster.—Detailed plans and quantities are being prepared by Messrs. Ashley & Winton Newman, 14, Gray's Inn-square, W.C.1, for the erection of the proposed block of tenements in Escher-street, S.W.1, for the Westminster C.C.

Westminster.—Extensive alterations, includ- ing new shop fronts, are to be carried out at No. 129, Victoria-street, S.W.1, by Messrs. Hickman, Ltd., 10, Great Russell-street, W.C.

Westminster.—The steelwork is being erected by Messrs. Dorman, Long and Co., Ltd., 4, Central Buildings, Westminster, S.W., for the large office building in Victoria-street and Arlington-street, S.W.1. The general contractors are Messrs. Holliday & Greenwood, Ltd., Stewart's-road, Battersea, S.W. The architect is Mr. J. Stanley Beard, M.S.A., 52, Baker- street, W.1.

Westminster.—Plans have been prepared by Mr. J. Ninian Cowper, 228, Knight's Hill, S.E.17, for the conversion of the enclosure at the south westerly corner of the nave of West- minster Cathedral into a chapel.

Woolwich.—New erecting shops and machine rooms are to be added to the works in Night- ingale Vale, S.E.18, of Messrs. Lister Bros., engineers. Plans have been prepared by Messrs. Whincop & Channer, 47, Thomas-street, Woolwich.

New Building Crafts School, Liverpool.

The Liverpool Education Committee has re- cently opened a new day school for instruction in the building crafts at the premises in Fontenoy-street which were, until lately, known as the Lord Roberts' Memorial Work- shops. The classes will be attended by appren- tices in the various sections of the building trade, and the programme of instruction will be so shaped as to make students at the end of their course, much more thorough masters of their craft than they could ordinarily hope to become by merely doing the work which falls to the lot of apprentices in the workshops of their masters.

Concrete Sleepers Experiment.

It is stated that one of the leading railway groups is negotiating for the purchase of concrete sleepers with which to experiment on a stretch of main line out of London. The new sleeper consists of two blocks of concrete joined together by a tie-rod of mild steel, each block is 24 in. long and 7 in. thick, and holds three plugs to take the screws of the chair carrying the rail. The chair rests on a layer of felt, and the inventor claims that this deadens the noise to a considerable extent.

OLD MONUMENTS.

THE fifth list of monuments prepared by the Commissioners of Works in pursuance of Section 12 of the Ancient Monuments Consolidation and Amendment Act, 1913, has been published by His Majesty's Stationery Office, from whom it may be obtained at Adastral House, Kingsway, W.C.2, or through any bookseller, price 3d. net. These are monuments of which the preservation is a matter of national importance, and they include the following:—

ENGLAND.

BUCKINGHAMSHIRE.—Ickford Bridge.
CHESHIRE.—Baguley Hall, Northenden.
CUMBERLAND.—Hardknot Castle, Roman fort, Birker; Old Penrith (Voreda) Roman fort, Plumpton; Barnscar British Settlement, Muncaster; Shouthwaite Gill hill fort, near Thirlmere; Old Carlisle Roman fort, Wigton.

DEVONSHIRE.—Sourton Down Cross; Holne New Bridge; Fingle Bridge, Drewsteignton; Bideford Bridge; Beckford Bridge, Membury; Lambert's Castle, Hawkhurst.

DORSETSHIRE.—Shaftesbury Abbey; the Conduit Cross, Sherborne; Stalbridge Cross; "Rolls" Bridge, Sturminster Newton; Fifehead Neville packhorse bridge; St. Aldhelm's Chapel, Purbeck; Powerstock Castle; Crawford Bridge, Spettisbury; St. Julian's Bridge, Wimborne; the site of Cerne Abbey, including the gatehouse, guest house, wine house and barn, Cerne Abbas; the Helstone burial chamber, Portesham; Abbey Barn and dovecot, Abbotsbury; Rufus Castle, Portland; Wool Bridge; Bindon Abbey, Wool; Holme Bridge, East Stoke; St. Martin's Church, Wareham; Preston Roman Villa; Preston footbridge.

HUNTINGDONSHIRE.—St. Ives Bridge; Wansford Bridge; St. Neots Bridge; Alconbury Bridge; Spaldwick Bridge; Nun's Bridge, Huntingdon; Huntingdon Bridge.

LANCASHIRE.—Eadsford (or Edisford) Bridge, Clitheroe; Cartmel Priory Gatehouse; Wraysholme Tower, Ulverston; Urswick British settlement; Gleaston Castle; Piel Castle, Piel Island, Barrow-in-Furness; Castle Hill, Pennington; Newby Bridge, Colton.

LEICESTERSHIRE.—Belgrave Bridge, near Leicester; the Raw Dykes, Aylestone, Leicester; Anstey packhorse bridge.

LINCOLNSHIRE.—The Newport Arch, Lincoln.

NORFOLK.—Castle Hill, Hunworth; Buckenham Priory and Castle site; the Gate House at Manor House, East Barham; Drayton Wayside Cross; Horsford Castle; Gresham Castle; Baconsthorpe Castle; Mileham Castle; Great Yarmouth Town Walls and Towers.

NORTHAMPTONSHIRE.—Geddington Bridge; Charwelton Bridge.

NORTHUMBRIA.—Section of Roman Wall east of Heddon on the Wall; section of Roman Wall east of Denton Burn, East Denton.

NOTTINGHAMSHIRE.—Margidunum, Roman station, East Bridgford.

SOMERSETSHIRE.—Bury Bridge, Dulverton; the Tithe Barn, Preston Plucknett; Congresbury Cross; Market Cross, Somerton; Castle Neroche, Culland; Market Cross, Cheddar; the Tithe Barn, Glastonbury; the Tithe Barn, Douling, near Shepton Mallet; Bishop's Tithe Barn, Wells.

SUFFOLK.—Eye Castle; Brandon Bridge; Market Cross, Mildenhall.

SUSSEX.—Stopham Bridge, Pulborough; the Land Gate, Rye; the Strand Gate, Winchelsea; the Ferry Gate, Winchelsea; the New Gate, Winchelsea.

WARWICKSHIRE.—Water Orton Bridge; Cook-street Gate, Coventry; Caludon Castle, near Coventry; Clopton Bridge, Stratford-on-Avon; Biddford Bridge; Furnace End Bridge, Shustoke; Colehill Bridge; Huningham Bridge; Perry Bridge, Handsworth; Castle Hills Castle, Fillongley; Polesworth Bridge; Marton Bridge.

WESTMORLAND.—Castlesteads British settlement, the Helm, near Kendal; Scalford British settlement, near Kirkby Lonsdale; Millrigg British settlement, Kentmere; Huggill British settlement, near High Borran; Eweclose British settlement, Crosby Ravensworth.

YORKSHIRE.—Catterick Bridge, Brough; Wakefield Bridge; Town End Bridge, Sowerby; Old Bridge over the Hebben Water, Hebben Bridge; Yarm Bridge; Beggar's Bridge, Glaisdale; Thorsgill Beck packhorse bridge, Barnard Castle; Greta Bridge, Rokeby; Kildwick Bridge; Tanfield Bridge, West Tanfield; Wensley Bridge; Romanby packhorse bridge; Rotherham Old Bridge.

WALES.

CARMARTHENSHIRE.—Carmarthen Castle (ancient portions).

CARNARVONSHIRE.—Carnarvon Town Walls.

MONMOUTHSHIRE.—Usk Castle (unoccupied portions).

MONTGOMERYSHIRE.—The Old Town Hall, Llanidloes.

PEMPROKESHIRE.—St. Patrick's Chapel, St. David's; St. Non's Chapel, St. David's; St. Justinian's Chapel, St. David's; Pembroke Town Walls; the Gatehouse known as Porth y Twr, St. David's; Haverfordwest Priory; the Close Wall, St. David's.

SCOTLAND.

WIGTOWNSHIRE.—Teroy broch, Craigcaffie, Inch; Invernesside, Inch; Boreland mote, Kirkcowan; Ring Hill fort, North Balfern, Kirkcubbin; High Drummore mote, Kirkcubbin; "Doon of May" vitrified fort, May; Cruise Back Fell fort, Upper Galdenoch; "Cairn Kenny" chambered cairn, High Murdoonoch; Bennan of Garvilland fort, New Luce; Stairhaven broch, Old Luce; Skaithe mote, Penninghame; Cairn Pat hill fort, Port Patrick; Doon Castle, broch, Ardwell; Torhousekie fort, Wigtown; "Castle Feather" fort, Burrow Head, Whithorn; "Burrow Head forts, Whithorn.

THE NEW LAW OF PROPERTY.*

Few people except lawyers realise the change that is taking place in the law relating to land. Mr. Topham commenced his first edition of *The New Law of Property* with these words: "The law relating to land has been entirely changed by the Law of Property Act, 1922." The reason for a new edition is made apparent by the first paragraph in the introduction, for the author has to say, "The law relating to land was entirely changed by the Law of Property Act, 1922," and then to explain that since that Act was passed the law of property has been codified in six statutes all bearing date this year, viz., The Law of Property Act, 1925; The Settled Land Act, 1925; The Land Registration Act, 1925; The Land Charges Act, 1925; The Administration of Estates Act, 1925, and The Trustee Act, 1925. This mass of legislation recalls to our mind a line in a nursery rhyme, "Wasn't that a dainty dish to set before a king?" for the Law of Property Act, 1925, which practically takes the place of that of 1922, consists of 209 sections and seven schedules; the Settled Land Act, 1925, of 120 sections and five schedules, and the Trustee Act, 1925, of 71 sections and two schedules.

It is hardly surprising that the author, in his preface, remarks, "The whole legal profession, except those who specialise in branches of law unconnected with property, must now become students again." Consolidating Statutes have many drawbacks as well as advantages; for instance, we consider it highly advantageous when legislating on such subjects as Workmen's Compensation, Factories, etc., to consolidate the law as soon as possible, giving those concerned in such domestic legislation one code which they can consult without the endless references to still partly existing Statutes, but even then the drawback may be that by a slight alteration used in the wording of the sections in the consolidating statute, the effect of decided cases may be rendered uncertain. This, however, can be avoided by adhering to the original wording of sections not repealed, a fact the draftsman sometimes loses sight of. Such wholesale consolidation of the law as has taken place in the above six statutes is quite unprecedented, and future generations may reap some benefit, but the layman turning for advice to his "student" legal adviser may have some misgivings on the costs involved by both teaching the law by affording practice as well as receiving instruction or advice upon it. The present edition of this work follows the same lines as that adopted in the first edition, and it is unnecessary for us in these pages to say more than if anyone is qualified to explain this mass of legislation no one can be better qualified than the Author. This work forms the fifth edition to his "Law of Property"; to his qualification as a writer on the subject he adds those of a Reader or teacher of the Law for the Council of Legal Education at the Inns of Court, and he was a member of the Sub-Committee appointed by Lord Birkenhead to take some part in bringing about the reforms embodied in the Law of Property Act.

We notice on his title page the author retains the reference to the "changes effected by the Law of Property Act, 1922." The greater portion of this Act has been repealed by the Law of Property Act, 1925, and we imagine those sections of the Act of 1922 which in the seventh schedule of the Act of 1925 are stated to be retained will be found to be repealed in one or other of the six consolidating statutes. It is certainly so in some cases, but we have not been able to go into this question exhaustively. In our ignorance we should have been glad if the author had

* Second Edition, being a Fifth Edition of "Topham's Real Property" (An introductory explanation of the Law Relating to Land), showing the changes effected by the Law of Property Act, 1922, and the six new Consolidating Statutes. By ALFRED F. TOPHAM, LL.M., K.C., formerly Whewell Scholar and Chancellor's Maillist in the University of Cambridge; Reader in the Law of Real Property and Conveyancing to the Council of Legal Education. (London: Butterworth & Co.) 1925. 15s. net.

dealt with this point in his introductory marks, for without going through the text it is difficult to ascertain at a glance whether or not any portion of the Property Act, 1922, remains in force. Perhaps as they are consolidating Statutes the author has not considered the point obvious, but a practitioner, consulting the Acts themselves, will at the outset be confronted with this culty and in the admirable index to volume we cannot find any reference under heading "Repeal."

PATENTS.

APPLICATIONS PUBLISHED.*

235,631.—R. T. Piscicelli: Slab building.
236,652.—R. W. Spencer: Pipe joints.
235,665.—Leabank Manufacturing Co., Ltd. and F. W. Kent: Garages, railway and vehicles.

235,671.—C. Fitzsimon, jun.: Moulding concrete blocks.

235,703.—F. J. Harrington and C. P. Harrington: Method of and apparatus for constructing temporary models of survey in relief.

235,713.—J. G. Fleming and D. K. Edge: Portable buildings.

235,714.—A. J. Hodgkinson: Pre-cast concrete blocks for reinforced concrete structures and buildings.

235,729.—R. R. Downie and Keystone Driller Co.: Excavating machines.

235,735.—A. A. Byrd: Monolithic concrete building construction.

235,757.—E. Canz: Work-benches, cut surfaces or blocks.

235,766.—W. J. Taylor and C. W. Cayle: Scaffolding and staging.

234,863.—Victaulic Co., Ltd., and F. Johnson, and H. R. Morgan: Spigot and socket pipe joints.

234,865.—J. Parsons: Building of houses.

234,987.—R. R. Gordon-Barrett: Windows.

235,005.—G. A. Ure: Domestic boiler places.

235,006.—J. A. Eriksson: Method for manufacturing porous concrete.

235,033.—A. H. Richards: Drains.

235,067.—W. K. Couch: Block flooring.

235,080.—R. H. Kirk and H. Martin: Equipment for the manufacture of concrete paving flags or slabs.

236,604.—T. White & Sons, Ltd., and White: Sandpapering machines.

236,625.—F. Von Niedmann: Locks.

236,676.—L. J. Hancock and Hancock Co. (Engineers), Ltd.: Blowpipe machines cutting metal.

236,732.—M. Bretos Y Claveria: Folding doors and shutters.

236,746.—Hume Pipe Co. (Australia), Ltd. and W. R. Hume: Manufacture of concrete slabs.

236,809.—G. H. Shaw: Casement window frames.

236,838.—O. F. V. Piper and C. D. S. Door stops, buffers, or silencers.

236,878.—T. White & Sons, Ltd., and White: Sandpapering machines.

236,879.—T. White & Sons, Ltd., and White: Sand-papering machines.

236,050.—J. Radcliffe: Road making.

236,259.—Sir E. Airey: Construction of concrete buildings and pillars or piers therefor.

236,262.—S. G. Turner: Briquette or loading machine.

236,278.—J. Temperley: Concrete and mixers.

236,279.—J. Allen & Sons (Oxford) Ltd. E. H. Stevenson: Apparatus suitable distributing road-binding liquid on to a road.

236,311.—R. Hickton and W. Baggett: Dies on pug-mills.

236,322.—L. Grote: Furnaces for kiln the production of cement.

* All these applications are now in the state which opposition to the grant of Patents upon may be made.

NEW COMPANIES

THE particulars quoted below have been compiled by Messrs. Jordan & Sons, Ltd., Company Registration Agents, of 116, & 119, Chancery-lane, W.C.2, from the documents available at the Companies' Registry.

JACOB WARD & SONS, LTD. (206,548). Registered June 10. Springfield Saw Mills, Oswaldtwistle, Lancs. Joiners, contractors, &c. Nominal capital, £3,500.

NEW AVENUE ESTATE CO. (LAINDON), LTD. (206,530). Registered June 9. 618, Romford-road, Manor Park, E.12. Builders and contractors, &c. Nominal capital, £1,000.

W. MOONEY & SONS, LTD. (206,466). Registered June 5. 11, Manestys-lane, School-lane, Liverpool. General builders and contractors. Nominal capital, £5,000.

LESLIES (BLACKPOOL), LTD. (206,454). Registered June 5. 37 and 37A, Clifton-street, Blackpool. Builders, furnishing and general ironmongers, outfitters and hardware dealers, &c. Nominal capital, £2,000.

AMERSHAM BRICK & TILE CO., LTD. (206,445). Registered June 5. Brick and tile manufacturers, &c. Nominal capital, £1,000.

STURBRIDGE BRICK CO., LTD. (206,442). Registered June 4. To acquire the premises of the Sturbridge Brick Co., and to carry on the business of brickmakers, &c. Nominal capital, £2,000.

WILLIAM KAY & CO. (MANCHESTER), LTD. (206,402). Registered June 3. 95, Corporation-street, Manchester. Builders' merchant. Nominal capital, £3,500.

W. SMITH (WOODTURNERS), LTD. (205,436). Registered June 4. 99, Rockingham-lane, Sheffield. Woodturners, joiners, builders and contractors, &c. Nominal capital, £1,000.

CANTLEY, DEAN & GUNNING, LTD. (206,370). Registered June 3. The Tile and Marble Works, Davigdor-road, Hove. Builders and contractors, &c. Nominal capital, £10,000.

NORWOOD GREEN ESTATES, LTD. (206,356). Registered June 2. Broadway Chambers, South-road, Southall. Builders, contractors, &c. Nominal capital, £6,000.

ANDERSON, ARMSTRONG & CO., LTD. (206,332). Registered June 2. 13, Upton-lane, Forest Gate, E.7. Building contractors, &c. Nominal capital, £700.

GODDARD & SON (BUILDERS), LTD. (206,787). Registered June 22. 36, Camomile-street, Bishopsgate, E.C.3. Builders, builders' merchants, &c. Nominal capital, £3,000.

D. & J. RANKEN, LTD. (206,810). Registered June 23. Builders and contractors. Nominal capital, £8,000.

NOEL REES, LTD. (206,813). Registered June 23. 21, College-hill, E.C.3. Manufacture and deal in concrete slabs, blocks, tiles, &c. Nominal capital, £2,600.

SOUTHERN COUNTIES BUILDING CO., LTD. (206,892). Registered June 26. 91, High-street, Chatham. Builders, contractors, &c. Nominal capital, £1,000.

RUGBY PORTLAND CEMENT CO., LTD. (206,971). Registered June 30. Cement and lime manufacturers and dealers. Nominal capital, £120,000.

PETERS & EVANS, LTD. (206,838). Registered June 24. Old Park-avenue, Enfield, Middlesex. Builders and general contractors, &c. Nominal capital, £100.

OLD TIMES CONSTRUCTION CO., LTD. (206,860). Registered June 25. Under Elm, Lay-lane, Kingsbury, N.W.9. Builders, decorators, contractors, &c. Nominal capital, £50.

WARREN & CO. (WANSTEAD), LTD. (206,973). Registered June 29. Cambridge Park, Wanstead. Builders, contractors, &c. Nominal capital, £500.

R. D. LOWN & SONS, LTD. (206,958). Registered June 29. 12, Ashbrook-road, St. John's Villas, Upper Holloway. Builder, &c. Nominal capital, £5,000.

W. A. WRIGHT (SHEFFIELD), LTD. (206,688). Registered June 17. Builder and public works contractor. Nominal capital, £100.

NEW BUILDINGS IN SCOTLAND

Wishaw.—SCHOOL.—The Dean of Guild Court has passed plans for the erection of a new High School to accommodate between 600 and 700 pupils. The estimated cost of the new building is £47,000.

Dunoon.—TEMPLE.—Plans have been passed for the erection of a Masonic Temple to be erected in Argyle-street, for the Dunoon Argyll Lodge.

Torrey.—SCHOOL.—The Aberdeen T.C. has passed plans for the erection of an intermediate school, at an estimated cost of £25,000.

Paisley.—ADDITIONS.—The Dean of Guild Court has passed plans for the erection of important additions to William-street and Abercorn Public Schools, for the Renfrewshire E.C.

Glasgow.—HOUSES.—The following plans have been lodged with the Dean of Guild Court:—Sixty-four houses and four villas at Shawmoss-road and Hags-road, for J. Adam & Co.; offices and showrooms at corner of Waterloo-street and Mains-street, for Metropolitan Vickers Electrical Co., Ltd., per Jas. T. Thomson, architect, 4, Jane-street; 130 houses at King's Park, Mount Florida, for McTaggart & Mickel, Ltd., per plans by Jas. Taylor, 166, Buchanan-street; ballroom, tea room and picture house at Renfield-street and West Nile-street, for G. Green, Ltd., per plans by John Fairweather, 182, Trongate.

Edinburgh.—VARIOUS.—The Dean of Guild Court passed plans: Church at the corner of Albion-road and Albion-place, the church will accommodate about 750 people, and will cost 14,000; W. Thyne, box factory at Marionville-park.

Houses, Airdrie.

The Scottish Board of Health has given approval for the erection of 20 houses at the napelside Lands site, for the Town Council. Each house is estimated to cost £337 10s. 2d.

THE SCOTTISH BUILDER

PITLOCHRY'S STEEL HOUSE

A "demonstration" steel house of the Atholl type, erected by Perthshire Highland District Committee, has recently been opened by Capt. W. E. Elliot, M.P., Parliamentary Under-Secretary to the Scottish Board of Health. In the course of Capt. Elliot's remarks, he said that Clydesdale was famous for its shipbuilding, and he hoped it would become equally famous for its steel houses. In Pitlochry twelve brick houses had cost fully £1,000 each. They were, therefore, indebted to the engineering firms who were constructing other types of houses, and to authors of schemes, such as the Duke of Atholl. The Duke, in thanking Capt. Elliot, stated he had taken up the scheme with the view of relieving the housing problem and of assisting unemployment. At a special meeting of the Highland District Committee it was agreed to build another four double houses of the "Atholl" type.

Concrete Houses at Saughton.

It is stated that Mr. Thos. L. Rae, for twenty years water superintendent to Clydebank and District Water Trust, has intimated his resignation in order to join a new company which has been formed for the erection of concrete houses.

Higher Standard of Housing in Scotland.

Speaking at the annual meeting of the Glasgow Workmen's Dwellings Co., Ltd., Sir Daniel M. Stevenson said that in no case was a public authority building houses of one apartment. It was a good thing, he said, that the standard of housing had been raised, but it was a pity that the standard had been raised without the occupants of the houses paying, or being able to pay, an economic rental. The consequence was that the country was being launched on a system of house subsidy which looked like being continued for many years. The house

ought to pay its way unless it was to be taken for granted that housing should be a public question in the same way as education.

Garages and the Glasgow Corporation.

The Dean of Guild Court is considering the question of the erection of garages by tenants of the Corporation housing schemes, two residents in Mossbank having been cited to appear in connection with alleged contraventions of the regulations by the erection of structures for the accommodation of motor cars. The Corporation do not object to the erection of wooden structures measuring 8 ft. by 6 ft. by 6 ft. for the storing of garden implements, &c., but the building of garages was not contemplated when this permission was given.

Kelvin Hall, Glasgow.

The Glasgow Corporation has instructed the City Engineer to prepare a new lay-out plan showing accommodation to be provided in the new hall to be erected in place of the building which was destroyed by fire. The special committee formed agreed with the Engineer's proposal that any building erected should be similar to the architectural features of the Glasgow University, the Western Infirmary, and the Art Galleries, all of which are near the site.

Housing Progress in Scotland.

The following figures show the progress that has been made in State-aided housing schemes in Scotland to July 31, 1925:—

	Completed.	Under construction.
1919 Act	24,769 ..	727
Private subsidy schemes	2,324 ..	—
Slum Clearance Schemes	1,566 ..	2,669
1923 Act	3,468 ..	6,269
1924 Act (Local Authorities' schemes)	168 ..	1,936
	32,295	11,601

Of the total number of houses completed and under construction under the 1923 Act, 3,075 are by the local authorities and 6,662 by private enterprise.

BUILDING TRADE WAGES IN SCOTLAND.*

The following are the present rates of wages in the building trade in the principal towns of Scotland. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

Salonica First International Fair.

Opportunities for widening their business activities are offered to British manufacturers by this Fair, which is to be held from October 18 to 31. Specially arranged and constructed pavilions and stands covering an area of 40,000 square metres are available in the heart of the newly-reconstructed city. The purpose of the Fair is :—(1) To afford an opportunity to the Greek merchants to come into closer business relations with their suppliers in the country and abroad; (2) to enable local and Near East merchants to get a wider knowledge of the vast field of production in the countries from which they import their requirements; (3) to concentrate in the Greek pavilion all national industries in order to make them known to a larger field and to create for them new openings; (4) to draw special attention to the section on Agri-

SEPTEMBER 4, 1926

ART EXPORTS

THE recent sale by Earl Spencer of Titian's "Venus and Adonis" to Mr. Joseph Widener created a certain amount of excitement both in art and commercial circles. There was the usual outcry in the press about the folly of allowing masterpieces to leave this country, and it was distinctly amusing to watch the conflict between art and wealth. It was computed that last year and 1923, Americans spent over £4,000,000 in Europe on objects of art of various kinds: how much has been spent in Great Britain, we do not know.

Students of history and political economy have been interested for some time in the Westward movement of art treasures. As a movement it is significant, or rather was, until certain countries began to impose export restrictions in the form of duties. It means that art treasures gravitate naturally to the countries which are wealthy and prosperous. It may, of course, mean much more than this: it may indicate a love of art, and that these established masterpieces may form a basis for the development of æsthetic taste in the United States. In matters of taste we will not attempt to define which is cause or effect, but we can safely say that a fine sense of taste has been combined with business acumen. We all have exclusive tastes, where we have the means to satisfy them. A picture may be worth £200,000 or it may be worth next to nothing, and everyone at some time or other has dabbled with the speculation of whether he would take the £200,000 or keep his picture.

The simple truth is that certain pictures have a distinct commercial value, which no one believes has any relation to their æsthetic value, and we part with them not because we do not appreciate them, but because we are too poor to keep them. Our nation we managed to acquire in the days of our prosperity a good proportion of the world's art treasures which came to us from the West, and if we cannot retain them all, it is because we are poorer or because other nations are wealthier. It may be urged that a country is really wealthy that is rich in art, but modern civilisation has given this philosophy a new meaning. Wealth, as a means of acquiring objects of art, takes the place of conquest by arms.

We are not in sympathy with those who have no scruples in holding the nation to ransom by forcing it to collect its art treasures by selling off its funds to retain the custody of its art treasures. We do not value the sacrifice in the cause of art, and, in fact, we doubt whether art has anything to do with it. The real strength of the healthy State does not lie in its hoard of antiques, but in the interest it displays in developing and encouraging contemporary art of every kind. We do not wish to claim for our æsthetic taste by trading in posthumous masterpieces: we prove it if we spend a little of our fabulous profits on sales in taking an active interest in the art of our day. One tenth of the money spent in prolonging our ownership of a single picture (and it is only a temporary ownership after all) would do more good to the cause of art, by saving things, than the loss of many masterpieces. If we took the practical point of view there would be no shortage of masterpieces, and public taste would have a significance we could understand. Meantime the dead stifles the

From the strictly economic point of view a nation is neither richer nor poorer by inflating the prices of its art treasures and keeping them in the country. All that happens is that the public is a little poorer, and a few individuals are richer; plus and minus cancel out, and we have kept the transaction within the family circle. The cause of Art has nothing to gain from this domestic arrangement of buying and selling: on the contrary, it suffers considerably if we neglect the art which is living by concentrating on that of the past. It is all to the good that America should spend some of her surplus wealth in purchasing objects of art in this country, and as a nation we cannot afford to neglect any opportunity of interrupting the steady flow of gold to America. We bought war material from America and contracted a large debt; we are paying back in works of art. On reflection there is something which is not altogether mercenary about the arrangement if we choose to look at it from the unselfish and larger point of view.

We have distinct regrets about losing the guardianship of our national masterpieces, but we do not agree with those who fear that the time is coming when we shall have none for ourselves left in the country. We have entirely misjudged human nature if there ever happens to be a depleted market for the art lover or the speculator. Every generation will find something that it will count as priceless, and if there is a shortage it will not be because the nation has lost its taste in art, but because the collectors have lost their skill. We do not regret the Westward movement of our art collections; we think it is more wholesome that we should have more works of art than that we should hoard our antiques. It is indeed an open question whether posterity has more need to be afraid of an ample supply of antiques than a shortage.

Meantime it is distressing to think that Bramall Hall (a fine old example of half-timbered-work) has appeared valueless as a work of art because it could not be shipped in a crate to America. This thought compels us to harbour no illusions about the humbug which arises when æsthetic taste reveals itself in commercial art values. It is, then, that we like to pretend that our taste is real because it is sentimental. We have heard it said that the repair of St. Paul's Cathedral has cost the nation as much as the purchase of an old masterpiece in paint. This is true, and the analogy will serve our purpose, though it is not our intention to contrast architecture with painting. We cannot help seeing St. Paul's; we can see it every day and enjoy the sight for nothing, and we are not in the habit of attaching values to that which we get for nothing. It is therefore to the credit of our nation that it realised the value of St. Paul's even if it were valueless in the jargon of commercial art.

The moral is that our trafficking in pictures is not the serious matter we pretend, and we need not be afraid of being labelled as Philistines. When we pay an enormous sum for a picture we are fairly certain that we have a valuable article which we can sell again; when we restore and preserve a beautiful building we cease to measure æsthetic values in terms of what is technically known as a "business proposition." St. Paul's Cathedral will remain as a tribute to a nation which knew the difference between æsthetic and commercial values, yet did not falter.

NOTES.

Legal Assistance for Architects. A LICENTIATE MEMBER of the R.I.B.A. writes to us as follows:—"Now that the R.I.B.A. and Society of Architects are amalgamated, perhaps some kind reader will inform me as to whether the R.I.B.A. undertake to safeguard the interests of their members who may be so unfortunate as to be engaged with local government authorities and large commercial firms, on lines similar to the Legal and Medical professions (the oldest 'trade unionists' in existence); if not, I would ask: What is supposed to be the benefit a member derives from merely paying his subscription year after year?" We are not surprised our correspondent should have asked this question, though we think he is singularly unfortunate if he has not discovered the benefits to be derived from membership of the R.I.B.A., even though there is not at present machinery for safeguarding the interests of members "on lines similar to the Legal and Medical professions." As a matter of fact, the question has been before the Institute for some time, and before the war proposals for the formation of a Defence Union were actually, we believe, approved by the Council. Since then the Council have, we understand, empowered the Practice Standing Committee to prepare a scheme for the assistance of members who need legal assistance, and such a scheme will, no doubt, be submitted and dealt with in the near future. Even as it is, the Institute has taken up cases on behalf of members where any question of principle has been involved, and would, we should think, do so again.

German Competition in Housing. THE news that a German firm is able to secure a contract for the erection of 230 houses in Dublin at a figure £4,000 lower than the lowest Irish tender, will come as a surprise to those interested in housing costs, especially as it is reported that the houses are to be built of concrete blocks "made in Germany." We have become accustomed to foreign competition in materials, but not in actual construction. The news is the more extraordinary when we remember that the chief claim of the concrete house to cheapness is that the walling, or walling units, can be made by unskilled labour from local materials. We have no further information so far than is contained in the daily press, and we are inclined to doubt whether this gives an accurate impression of the facts. Messrs. Kossel, the firm in question, have for some years made a speciality of building concrete houses, and among other places they have been responsible for a number on Mr. Kepler's big Amsterdam scheme. But their system makes no use of pre-cast concrete units. It is a monolithic system, in which a slag and clinker concrete is poured between a highly-efficient wooden shuttering. We do not, of course, know whether the firm is proposing to use a different system for these Dublin houses, but we think it is highly probable that all that will be "ready made in Germany" is the shuttering. Certainly it would be remarkable if lower wages, together with the difference in the rate of exchange, made it possible to deliver German concrete blocks in Ireland cheaper than the home-made article, for as the cost of transporting them from the docks to the site would not be less than the cost of bringing sand and gravel from the pit, the saving in cost could only be effected

by the difference in unskilled labour Germany and Dublin.

The Housing Subsidy. MR. JAMES P. ORR, Director of Housing to London County Council, writes to the *Times* of Wednesday reference to the housing subsidy incidentally gives figures to show how difficult it is to escape from overcrowding in tenemented houses in London. The course of a survey of 153 homes in a group of typical tenemented houses in London 20 families were last year found to be in need of early relief from really serious overcrowding, and it has taken 12 months of continuous effort to find the first of 20 new homes needed. "A modern five-roomed flat," he says, "rented at £10 per week, has at last been secured for a family of six, who have for the last years been trying to escape from overcrowding, rooms, rented at 8s. 9d. For these rooms the landlord now gets 27s., instead of 8s. 9d.: one is let furnished at £10, the other unfurnished at 12s. The family has been secured as an extra room for a family of ten, who have for eight years lived in two dark basement rooms in the same house. The two families thus relieved could afford high rents, and in each case there were several workers, and the family earnings came to a total of £10 per week; but few of the remaining 18 families can afford more than £5 per week rent."

A Suggestion. HE says that it is the duty of the large young firms who needs relief, and suggests the payment of rents on a sliding scale according to income for houses of accommodation, and says, "there is no reason why it should not necessarily be then any greater loss

sidy scheme than there is now, if houses are let in pairs, one at somewhat more, the other at as much less than average rent. The L.C.C.'s estimates of 24-5 show that on the average the purse pays 18s. towards the economic rent (31s. per week) of each of the Addison houses erected by the up to last April." It has already suggested in our columns that system by which relief should be to tenants who cannot afford to pay economic rent for the houses they would be better than the present, and we can understand Mr. Orr he says, "Why should every tenant the same subsidy without reference at he can afford? Why should we flag the subsidy by talking as 13s. were the full rent? Why the 31s. rent and the 18s. rebate? ure to suggest that in each locality nts for houses should be classified lieved in order of the urgency of need of relief; that in each case ate should be limited to the m necessary to secure that relief."

Rot
ber.
y, and it is well that the best

THE question of dry rot in timber is of great importance to the architectural profession and the building

methods of identifying and dealing with it should be known. Mr. Alan E. Munby, in referring in *The Times* to the help given him by the Natural History Museum in identifying fungi in building timber, says the subject embraces a cause of immense annual loss to the country and upon which much remains to be learnt. "The ravages of dry rot," he says, "which often involve the partial demolition and reconstruction of buildings, are so common and widespread that it seems extraordinary that more research upon the diseases included in this term are not in progress. Besides the Natural History Museum, the Imperial College and (quite lately) the Department of Industrial Research deal with this subject, but only in a very limited manner, and not on a scale at all commensurate with the importance of the problem. . . . The Royal Institute of Architects has been pressing the need for research on dry rot from time to time for some years, and the British Science Guild has recently had the subject before it for discussion as one of national importance." As the subject is receiving attention, we may refer to the article by Professor Groom, published in *The Builder* for May 30, 1913, and subsequent issues, and the letters in our Inquiry Column this week.

The National Joint Council for the Building Industry. A BALLOT on a new national wages agreement for the building industry has just been completed by the unions affiliated to the National Federation of Building Trades Operatives, with the exception of the bricklayers' and plasterers' organisations, which recently seceded. This agreement will bring to an end the present Wages and Conditions Council and its constitution and will establish a National Joint Council for the building industry. Wages will be reviewed annually in January of each year and adjustments will be made on the average cost of living figure over a yearly period. The present wage rates will be based on a cost of living figure of 78 per cent. above the 1914 level, and with every rise or fall of $6\frac{1}{2}$ points there is to be an increase or reduction of a halfpenny an hour. The result of the ballot will not be announced until the emergency committee of the Federation meets late this week to consider the returns, but we understand that the agreement has been ratified by the unions. The agreement affects very little the agreement between the Employers' and Operatives' Federations, but the substitution of the name of National Joint Council for the old title is to be commended.

One of a Pair of Bedroom Windows in Stained Glass, Braintree.

By MR. LEONARD WALKER, R.I.

GENERAL NEWS

Bonar Law Memorial.

The 12 ft. Scottish cairn erected in memory of Mr. Bonar Law at Rexton, New Brunswick, where the late British Premier was born, will be unveiled on September 17.

New Church at Rothsay.

A church to seat 800 has been opened at Rothsay. It is in the Norman style, and was designed by Mr. R. Fairlie, A.R.S.A., of Edinburgh.

Architect's Estate.

Mr. Vincent Craig, F.R.I.B.A., J.P., of High Close, Wokingham, Berks, formerly president of the Belfast Art Society, who died on July 1 last, left property of the gross value of £110,603 7s. 1d.

Wooden Houses for Hendon.

The London County Council are contemplating building some 2,000 wooden houses at Hendon as a result of Mr. G. Topham Forrest's visit to America, where he was very favourably impressed with the possibilities of adopting timber-framed houses in this country.

Pickering Castle.

At a recent meeting of the Pickering Urban District Council it was agreed that, subject to certain terms, the Office of Works should take over from September, 1926, the ruins of Pickering Castle and its grounds under the scheme for the Preservation of National Monuments.

R.I.B.A. Scholarships.

The Board of Architectural Studies of Cambridge University have awarded the R.I.B.A. (Anderson and Webb) Scholarships as follows: First year student, £35, to R. F. Henniker, Trinity Hall; second year student, £35, to C. D. G. Nicholson, Jesus College.

Armagh Housing Scheme.

The Armagh Rural Council recently had under consideration 53 representations for labourers' cottages, the first of a batch of 300, under the Labourers' Acts. The scheme is estimated to cost between £80,000 and £100,000.

Archæological Find at Sandwell Gate.

There has been removed to the Hartlepool Museum an interesting archæological find recently discovered near Sandwell Gate, Town Wall. It is the servery hatch to the Refectory or dining-hall of the Saxon monastery which at one time existed there, and had been built into the wall of a subsequent structure, now being demolished.

Road Improvements.

£6,500,000 has been allocated from the Road Fund, administered by the Minister of Transport, for the improvement and modernising of several trunk roads throughout the country. About 40 county councils are concerned in the programme, and the parts of the great highways that are to undergo improvement reach a total length of 500 miles.

Liverpool Rehousing Scheme.

Plans have been prepared in Liverpool for a large rehousing scheme, which will involve the rebuilding of a residential belt affecting a population of at least 50,000. The Housing Committee propose to erect at the Dingle—the south end of the city—a ten-story block of tenements for the first lot of residents to be removed, and a similar block of tenements for the north end is contemplated.

Ashted Forest Excavations.

A Roman site covering at least several acres has been found in Ashted Forest, and the foundations have already been unearthed of what are believed to be the indoor bathing quarters—centrally heated from a charcoal furnace—of a large villa, including a hypocaust 20 ft. 7 in. by 10 ft., and, what is rare in Roman buildings in this country, a circular chamber 17 ft. in diameter.

Salonica International Fair.

We are informed that owing to the very short time the prospective participants would have for the preparation and dispatch of their exhibits to Salonica to be in time for the opening of the Fair, the organisers have found it necessary to postpone the opening to a later date—probably the spring of 1926, but the date has not yet been fixed.

Beet Factory for Felstead.

The Anglo-Scottish Beet Sugar Corporation, Ltd., have now definitely decided to proceed with the erection of a beet factory at Felstead, at a cost of £250,000.

Reconstruction of Dublin Customs House.

The work of rebuilding the old Dublin Custom House, which was destroyed during the trouble of 1921, is proceeding rapidly, about 180 men being employed.

WAR MEMORIALS.

Scotland's War Memorial.

Considerable progress has been made with the reconstruction of the old barrack building on Edinburgh Castle rock into a Gallery of Honour, which is to form, with a shrine on the north side, the Scottish National War Memorial. Mr. P. Jackson has completed the sculpture of the great arch, nearly 30 ft. high, that leads from the gallery into the shrine; the latter has been carried up to the level of the springing of the stone vault. At each end of the Gallery of Honour there is to be a window, the one to the Navy and the other to the Air Force, and these are almost complete. The bays for the memorials to the twelve historic Scottish regiments and other units are taking shape, and the doorway forming the lower story of the porch—which will be the central feature of the exterior looking south into Crown-square—is completed. The work is under the supervision of the architect, Sir Robert Lorimer, A.R.A., and the Duke of Atholl's committee.

St. Quentin Memorial.

Marshal Foch recently unveiled at Mont St. Quentin, in the Somme, a monument erected to the memory of Australian soldiers who fell at the Battle of St. Quentin.

Longford War Memorial.

General Sir William Hickie recently unveiled Longford County War Memorial, at Longford; it is in the form of a Celtic Cross, and stands in the Market-square.

Pallerton War Memorial.

A war memorial, consisting of a granite obelisk, was unveiled at Pallerton recently.

Actors' War Memorial.

A war memorial to the actors who lost their lives in the war was recently unveiled at Stratford-on-Avon. It was designed by Sir George Frampton, R.A., and is in the form of a marble panel.

Owlerton War Memorial.

The foundation stone of Owlerton war memorial will be laid on September 19. The memorial takes the form of a large hall capable of seating 500 people, and will cost £5,000.

COMPETITION NEWS

Model Dwellings Competition, Russia.

THE Russian Government has issued particulars of a competition to be held for the purpose of providing model dwellings for working-class homes in Russia. The particulars issued are of considerable interest although it is very unlikely that they will have any response from British architects.

The document is headed "First Contest of Projects for Model Workers' Homes announced by the Moscow Soviet of Workers, Peasants and Red Army Deputies." Discussing the gravity of the problem and the necessity for cheap-

ing the costs by rational methods of construction, cheaper materials and efficient plans, the document goes on to say that they are "interested in methods and proposals which, however brilliant in themselves, cannot be easily and profitably carried out just now for the purpose of erecting workers' homes in the and Province of Moscow." Attention is mainly called to new building materials, competitors should feel quite free to suggest revolutionary and daring ideas, free from tradition and prejudice. Pure reasoning, building mechanics and pure physics—these the only laws obligatory to the architect in selection of materials and constructive method... the plan must be co-ordinate with the requirements and living habits of our workers. It should prompt our workers to quit unhealthy habits inculcated by living in uncomfortable dwellings, should not prompt the workers to excessive luxury and increase household expenditure. The project must suit the proletarian test from the æsthetic standpoint.

The types of houses proposed are:—

1. The two-story house containing on floor 4 to 8 dwellings.

2. The house of the ordinary block type no less than 3 dwellings each located on floors.

3. The three- or four-storied fire-proof house with central heating with not less than three entrances to the dwellings from the landing each floor.

There are three types of dwellings:—

1. Bedroom, living-room, kitchen, &c., a total floor space of 450 square feet.

2. Two bedrooms, living-room kitchen, with a total floor space of 540 square feet.

3. The same accommodation with 630 sq. feet.

Each type is to have a bathroom, but alternative plans may be submitted without. The ratio of dwellings per house is two to 50 per cent.; three rooms 30 per cent. than three rooms 20 per cent.

Minute particulars are given as to the requirements of construction and sanitation and the various drawings to be sent in. In the case of special constructions, quantities and costs have to be provided. Five prizes are offered each type of house, the total of the first prize being £650. The judges present a formidable list of names and represent all sorts of interests, Soviet, the Planning Commission, the Trade Unions, Building Workers' Unions, the Municipal Engineers, the Architects, the Engineers, the Department of Health, the Technical Commission of Moscow Workers and the State Building Office.

Competitions Open.

	Particulars published in "The Builder."	See in
Drammen Bridge (Drammen-selven). Premiums: 10,000 Norwegian crms., 8,000, 6,000. Apply Gov. Eng., Drammen.	May 29 ..	0
Newcastle Fire and Police Station. Premiums: £500, £300, £100. Mr. P. S. Worthington, F.R.I.B.A., Assessor.	June 12 ..	0
Town Hall, Pretoria. Open to architects residing in South Africa or Registered under Architects' Act, of 1909, Transvaal. Assessor to be appointed by R.I.B.A. Premiums: £250, £150, £100.	— ..	N
Argentine Institute. Premiums 10,000, 6,000, 4,000, 3,000, 2,000 gold pesos. Apply parties., 35, Old Queen-street, S.W.1	April 24 ..	D
New Buildings for Liverpool College, Mossley Hill. Sir Giles Gilbert Scott, R.A., Assessor. Premiums: £500, £300 and £200. Apply to J. H. Lintern, Secretary, Liverpool College, Sefton Park-road, Liverpool.	Aug 7 ..	3
Australian War Memorial, Canberra. Open to architects of Australian birth. Apply High Commissioner, Australia House, Strand, London	Aug. 14 ..	M
*Enlargement of Carnegie Hall, Dingwall	— ..	
*Flee wood Hospi al	— ..	

* Competitions when "warned" or vetoed R.I.B.A. are Starred.

Birkenhead War Memorial.

PROFESSOR LIONEL B. BUDDEN, M.A., A.R.I.B.A., Architect. MR. G. H. TYSON SMITH, Sculptor. (See p. 352.)

CORRESPONDENCE

[While we are glad to publish letters on professional and other matters of interest to our readers, it must be understood that we do not necessarily endorse the remarks of correspondents, who will oblige us if they will express their views as briefly as possible.]

London.

SIR,—The present is an age when nearly everyone is ready to discuss the spoliation of the Metropolis. There is scarcely a newspaper that does not give some space to the subject, either in the form of an attack against a quarter scheduled for improvement, or an article lauding the merits of some new building projected for the benefit of commerce. As an Englishman and a lover of London, I claim to set forth some of the ideas which occurred to me during a recent perambulation in town.

There is a point that has puzzled the chartered architects of Great Britain as well as those who form the audience and suffer in silence; it is whether it is preferable to have the amenities of London preserved, or to continue to allow haphazard changes. This, to my mind, is the political aspect of this very serious question. During the past fifty years I have watched London changing from its old urbanity to an overgrown collection of districts which stretch into the home counties. It is still a series of villages grouped about London and Westminster, it still retains its mediæval tortuosity, but in spite of legislation it is inchoate and unintelligible. Having got rid of my preface, I will proceed to enlarge on the theme. London defies analysis; it is impossible to say what should be done or on whom to place the responsibility for the preservation of seamliness and order. For any one man, or for that matter any public body, to assume the gesture of Canute would be idle and pernicious. But, notwithstanding these objections, we should take instant measures to discover the remedy for the evils which are overwhelming the entity of the Metropolis.

Every one is familiar with the problem of housing as it affects Londoners; there are some who profess to be proud of their city and its vast size; to such the difficulties connected with transport seem trivial, they prefer to see the near countryside choked with villas and bungalows, to a remodelling of districts and parishes within the true London area.

When the London Society prepared the new map of London with suggestions for preserving open spaces whereby the future growth of residential districts could be regulated, few realised the inner movement which had been in progress for many years. Soon after this map was published statistics were prepared attempting to record the various trades and activities; doubtless these have been carefully pigeon-holed.

It happens that London develops internally as well as outwardly without the aid of statistics. The centre of business has changed; no longer does it imply the City and the vicinity of the Bank. It now covers an area from Whitechapel Church to Hyde Park Corner, and extends from the north bank of the Thames to Euston-road. In this inner movement the streets of Clerkenwell, the squares of Bloomsbury, and the whole of the district west of Tottenham Court-road can be included. Therefore, it is feasible that by the end of the present century this section of London will be practically non-residential.

For many years past schemes have been projected for the reclamation of South London, particularly those districts which form the hinterland along the south bank of the river, but such is the natural inclination of Londoners for the higher ground that few have the heart to further the idea of a newer London across the water.

There remains the question of remodelling such fourth-rate districts as Highbury, Canonbury, Holloway, Camden Town, Kilburn and parts of North Kensington. Scarcely a century since these places were rural in every sense of the term. They have since passed through the drab period of Victorian respectability, and have descended to the neglected state. Much could be done to bring about an alleviation of the shortage of houses in these districts by

building blocks of flats in place of the huge Victorian residences which are mainly let into tenements. There are bad patches in the midst of these inner suburbs of North London, but they are as heaven when compared with the drabness that oppresses the Londoner from Westminster Bridge to Catford in the one direction, and to Clapham Common in the other on the south side of the river.

The new arterial roads, such as the one from Chiswick to Staines, on the west, the north circular road, now being constructed, the new road to Southend, the new Watling-street in Kent, and the new by-pass road from Wood Green to Cheshunt, are well-considered improvements. They have, however, the fault of collecting fast traffic and of choking the comparatively narrow roads upon which they debouch. Until such roads are continued well into the centre of London, the present traffic difficulty will continue. Even those who have no inclination to ask for such logical improvements as the above suffer for their apathy. It is a mistaken policy—this passive acceptance of inconvenience. It is all very well to say, as many do, "that a hundred years since, the country was within walking distance; in Victorian times it was within an omnibus ride, and now it is an easy journey by tube"—or to state that inner London is just as accessible to the suburban dweller of to-day as it was to those who, a century since, came in by the short stage from Stamford Hill, Greenwich, or Turnham Green. It is not, to my mind, the comfort of the individual that has to be considered, but the comfort of the myriads who are employed in town during the day. Hence the argument in favour of flats being erected within the five-mile radius. During only last week, I could not help being struck by the position of the great markets. Here is a subject that might well engage the immediate attention of the authorities. The decentralisation of Leadenhall Market, Smithfield Market, and Covent Garden would do much to relieve the traffic problem. There is room for a dozen such markets, one of each kind, in the residential parts of London, and it is somewhat anomalous to retain such centres of congestion so far from the people they are intended to serve. In the case of Billingsgate, owing to its riverside position, it should be retained, but riverside markets of lesser size might well be established on either side of the river as far as Richmond.

It is well known that chaos begets chaos. The very ungainliness of London has a fascination for the unthinking; no longer can its deformities be held up to admiration, neither is it flattering to refer to the Metropolis as the modern Babylon. The interest of London is in its old buildings, in the spacious squares and vast parks, the majestic sweep of the river and the lordly grandeur of its fashionable centres. But the vaster London that has grown without and around, the interminable labyrinth of drab streets, shabby and decaying, the pathetic rows of struggling shops, the sordid glitter that accompanies industry, is a lasting reproach and a menace to society at large. I feel, Sir, that you will pardon my somewhat lengthy letter. As one who lives in the provinces, I am privileged to know London perhaps as well as any person who lives in town. My visits are not infrequent; to me, she has an interest that calls for the truest sympathy. I am appalled at the changes. What are Londoners about, to sanction office buildings in Euston-square? How can they tolerate the desecration of Mornington-crescent? Has London grown so large that her rulers have become blinded to her pressing needs? Her streets are well paved, none will question the lighting, the drainage, or the building regulations, but her good looks are waning, she is becoming untidy and sluttish, and such indications are depressing to those who know her best.

EDWARD MASSINGHAM WARBOYS.

Manchester Art Gallery Lighting.

SIR,—I have been reading the article in the *Builder* on the lighting of the proposed Manchester Art Galleries. Galleries are provided to enable the general public in their thousands

to see pictures, not to meet the views of armchair philosophers. I have been in the Manchester Art Gallery hundreds of times, spent hours there, half-days, and have found the light perfect from every point of view. I have never noticed a single visitor in any way affected by any deficiency of lighting.

The writer of the article complains of width of the galleries having been limited to 30 ft.; it would be a gross waste of public money to make them an inch wider. If the system of top-lighting of the present Manchester Galleries were repeated in the proposed galleries the Manchester public would obtain everything they desire. By all means let the writer of the article continue his theoretical studies of lighting of picture galleries, but it would be absurd to spend public funds to give effect to them, whilst we have a system which has stood the test of time and gives the general public who pay for them, everything they want.

If a few artists and theorists want a special type of lighting they must provide their own galleries; they have no claim on public funds. The general public are satisfied with the system of the existing art gallery; I have never heard of a complaint.

Manchester.

T. SINGO.

SIR,—Whilst most of Mr. Seager's criticisms in your columns is beyond controversy, the conditions of the competition is of doubtful value. Glazed and unglazed pictures can be placed respectively on opposite walls; ceiling spring blinds can be installed. The balance in favour of narrow galleries—first of running cost, public convenience, and general wall space—is enormous.

Museums partly side, partly top-lit, seem both minimum first and running costs for efficient lighting, if a little thought be given to the design and arrangement of the exhibits.

Manchester.

A. HENTHORN STOR.

Proposed New Shirehouse Extension, Norwich.

SIR,—Having visited the exhibition of designs submitted in competition for the new Shirehouse, I was very surprised to discover that the winning design has no resemblance in any way to existing building. It will be remembered that there was a condition which stipulated "The design need not follow the old in style detail, but if departed from an effort should be made to avoid too great a contrast between old and new."

The winning design shows the greatest contrast I have ever seen, and as an outside observer I do not think that justice will have been done to other competitors who have based their whole design on the existing building if winning design be accepted.

I trust that the responsible parties will understand the general feeling in the matter, and an explanation seems to be necessary.

E. Yrks.

A. F. SOSITT.

A Stained-Glass Panel from a Door in St. John's Wood.

By MR. LEONARD WALKER, R.I.

SOME PERSONAL VIEWS ON STAINED GLASS

By LEONARD WALKER, R.I.

ARTISTS work, in a sense, in different worlds. I can imagine that the sculptor's landscape is crowded with shining marble quarries under southern skies. For all I know, the leather-worker must be always chasing after cows for a view to their conversion into the binding of a sumptuous volume. Perhaps the wood-carver sees forests, various trees of prodigious things—and so on.

The architect's world is very complex; all his dreams are chivied about with demands of clients, building regulations, utility—Beauty most screened by a hundred and one petty annoyances.

I'm in a world of fragments of bottles and shattering bits of slabs of glass, and strips of lead.

In surveying the various materials we work with, they all have special and individual requirements; some display their inherent qualities, others are more legitimately veiled by form and colour and representations of form. The painter of the easel-picture unblushingly may conceal his canvas; the black-and-white man does not hesitate to hide his white paper with black ink or wash. Again, the book binder controlled somewhat by the contents of the book he is binding—the maker of a fountain pen so much so, except in so far as the inside of the good receptacle for the water-pipes.

The percentage of importance of the factors which make up our work varies considerably. Things can be expected and allowed on a basis which a sculptor would scorn. A piece of plaster does not ask for so much decoration as the same shape in another material: a piece of marquetry is decorative in itself.

With the exception of architecture, which divides us all, we may divide the materials of our crafts roughly into three groups in relation to light. The majority are opaque and reflect only; we have a little group semi-opaque, like jewellery and mosaic; and finally we have translucent material glass, transmitting light.

Now, it will be admitted that this material of glass, with its varied thicknesses, at times veiled by colour, which transmits light, is something to be admired in itself. Its jewel-like qualities can more adequately suggest the brightness of nature than any other—white instead of the limited white pigment. Our work can be displayed by it to its fullest; in speaking of colour and its effect on us, one almost treads on holy ground. It holds hold of us in an uncanny way; we come into its embraces, and it moves us as when we are stirred by the musicians' mystic art.

The first windows were translucent coloured glass, stuck together, I believe, with some kind of cement. Then came progress with its advantages and disadvantages—the manufacture of glass with greater transparency, more fluency; the discovery that a glass-pan could be painted on the glass and protected by firing, and the joy of reproducing the play of nature by its means on the glass.

In the designing and shaping of our pieces of work for a fixed aperture, we come to the question of what manner, theme, representation, is legitimately harnessed to enhance, and to mask, the precious qualities of the material. We can apprehend a piece of work, and all the factors which make it up—material, and shade, form, everything in a moment. I suggest that in creation it is in the balance of all which must be watched carefully. If one of the scales is too heavily weighted in one direction, there is

beauty. So we descend to paintings on glass, a mere misuse of material.

Now, paper and canvas can be more heavily and beautifully weighted with representative matter, because the material on which or with which you work, has no great beauty in itself. It is only by the most intimate knowledge of the character and language of your material that you can gauge how far exactly it is inviting, or how it would repel elaboration and representation if it could speak.

We have heard all this before—but just a minute. Heard? Yes, but have the precious and unique gifts of the gods to coloured glass been guarded and preserved? Not always faithfully, I fear. With a nice smooth, slippery, polished surface, the designer and executant being separated, it was easy for the fascination of the application of a brush to grow to such an extent that interest was sidetracked to other things, to pictures on glass, which other materials and crafts could more legitimately display.

Glass has taught me that its chief function is to embellish the translucent parts of the walls of a building, whether in cathedral or in cottage. Now, what should be the appearance of themes, whether represented by figures, pattern, &c., when conditioned by this material of glass?

Take a tree, and see it in an early morning mist, when its form is veiled; see it at noon when its myriad of forms are definitely expressed; or, again, by twilight or moonlight, when perhaps only its silhouette is visible; or see it with a strong light behind it; the sun's strong rays of dazzling light obscure the form, revealing a thousand interstices of jewel-like brilliance of different degrees of strength. What has happened to the tree? It has ceased to be of great interest to the botanist, the archaeologist, the arborist, the historian; it is just a vehicle to call up other things to our minds. It seems to say, "Don't look at me, look at the light coming through me."

Again, take a white female figure, in a garden. Under how many varied conditions could she be seen? Just take two—possibly outlined definitely against a black shadow, or possibly broken into innumerable fragments as she passes a bush of red roses. In the latter instance the figure is subordinated to a medley, if you will, of shining patches of white and green and red; in other words, the light reflected from her frock, from the leaves and from the roses, is dominating our vision. The tree in the former and the figure in the latter instance have sacrificed themselves for what I think a sufficient end.

Though different kinds of views of nature may be accepted and translated by the painter or worker in other crafts with considerable freedom and choice, the genuine glassworker loyally accepts the restricted view which the demands of the material impose. Of course, a figure or landscape, painter can take a subject and put it on glass and hoodwink a few more millions, but the result is not real glasswork. We shall all recall some pictures on glass which have little more relation to the material than the chalk efforts of the pavement artist have to the stone.

Now, as our work is created to be seen, what of the beholders? The human being does not always want to hold out his brain as you might your hat to be a receptacle for a number of historical facts, glorious truths expressed with the most perfect diction; he may know them or can do without them. He or she may just want an accompaniment to his or her vocation, whatever it may be, something, perhaps, which when looked at chases away a cloud. Coloured glass can do this. It has surprised me how just a rhythmic arrangement of harmonious colour patches suitable as pendants or worked in with simple glazing, has given pleasure in houses where one anticipated more meticulous requirements.

Curiously and happily enough, the demands of the material coincide with factors which are likely to give the owner perpetual pleasure. Glass seems to demand for its fullest display a certain element of mystery and suggestion, rather than a drummed-in series of tabulated facts. This latter, if unduly exhibited, not only kills the fullest expression of the glass, but will eventually kill the client, or whoever is perpetually brought in contact with the work. Play, however excellently, the same Chopin waltz or prelude every day to a man at breakfast, see what he would do; but let a musician just happily extemporise, leaving play for the listener's imagination, and the result is different.

I am not trying to preach a gospel that any mass of bits of glass thrown together in chaotic confusion can produce anything but confusion. All I ask for this material, for the reasons I have mentioned, is more freedom in the manner of representation than you would permit—and quite rightly—in other crafts.

With regard to architectural setting the proper use of glass prevents any over-emphasis of the third dimension. On the other hand, one must avoid the flat, pass-everything-under-a steam-roller policy, but try to secure depth boiled down—something of low relief. Perspective sobered by good design can join in the fun.

Just a few thoughts that guide me. I take simple words, not the confusing ones of the pigment maker. Just blue, red and yellow, orange, green, purple and grey—the primaries—co-existing in equal quantities, in faint and delicate form; white, and in darker form, grey and black. Lead lines are dark grey. Certain colours seem to harmonise easily, others want more management. It's like a hostess, a little tired of asking the usual folk who get on well together, to her table, so invites the Puritan, the Bolshevik, the boxer and the poet; her powers then are really tested.

I look on crude colour as selfish colour, i.e., never speaking except to ventilate in monotonous voice its particular colour.

With the cartoons in a way done, but left for modification at the dictates of the material, the prologue is over, and you enter the stage when, with joyous fascination, you select the exact colour and character of glasses required, to produce, maybe, in places a series of tints expressing the subtlest of changes of one colour to another.

THE RATING AND VALUATION BILL

REPORTS are rather scanty as to the proceedings of the Standing Committee in reference to the Rating and Valuation Bill, but it appears that when the sitting was resumed a Government concession was made as regards the deductions allowed by clause 21 and the Second Schedule of the Bill from the gross value of certain properties in order to ascertain the net annual value.

In the Schedule the first category of hereditaments is "Houses and buildings without land other than gardens where the gross value does not exceed £40," and the amount of the deduction is 25 per cent. in respect of these hereditaments. The Minister of Health proposed a concession in connection with these small properties by splitting the £40 limit into two categories; on properties where the gross value did not exceed £20 he proposed an allowance of one-third, and where the gross value was between £20 and £40 an allowance of £7, or the 25 per cent. named in the Schedule, whichever amount should be the greater. This proposal, after discussion, was adopted.

The Bill is hardly likely to pass into law this year, for the Autumn Session will probably be too short for a measure of this kind to be considered, but as it has suffered so much change in its passage through Committee and the report of the proceedings has been both slight and interrupted, we propose, when the Bill is printed as amended in Committee, surveying it as a whole.

THE BRITISH ASSOCIATION

The British Association, at their recent meeting at Southampton, discussed a number of subjects of direct or indirect architectural and building interest, among these being the possibility of producing a new smokeless fuel from peat, the progress of the art of map-making, the desirability of encouraging the use of Empire-grown timber, and new methods of electro-plating. The substance of these papers is given hereunder.

Commercial Value of Peat.

The commercial feasibility of starting what would be, in effect, a new industry of first-class importance in this country, by a greatly increased use of peat fuel, was the main contention of a paper on "Recent Progress in the Peat Problem," by DR. R. MOLLWO PERKIN in the Chemistry Section. After reminding his audience that the quantity of peat in the United Kingdom and Ireland amounted to over 8,000,000 acres of an average depth of 12 ft. to 14 ft., he discussed previous schemes, both British and Continental, for the large-scale utilisation of this fuel, and attributed their more or less general failure in most cases to the difficulties of removing the water contained in the peat and the want of practical methods for doing this. He said that having for seventeen years studied the various peat propositions and watched the failures, and having worked on his own lines, he had found that by macerating the peat under suitable conditions, extruding as much water as possible; then passing it into an autoclave and heating under regulated pressure, which caused a certain rise in temperature; then suddenly discharging by means of a sluice valve and afterwards filtering or pressing off the necessary amount of water; and then passing the peat directly into the press, briquettes containing only 18 to 20 per cent. of water could be produced.

The speed of this particular plant would be such that the peat from the time it left the bog would be briquetted within eight hours, and these briquettes were immediately ready for transport, and, being very hard, would not break up or disintegrate.

From peat we obtained cheap briquettes which were smokeless and a very valuable charcoal for metallurgical purposes and as a decolorising agent; and in the producing of this charcoal a high yield of oils could be used for motor purposes, lighting purposes, and as fuel oils, thus assisting the Empire to produce the oil which it would otherwise, as at present, have to import from abroad. There were millions of tons of peat to be worked, and on the average they were very low in ash and very low in sulphur and phosphor. The specific gravity of well-briquetted peat was about that of coal; consequently there would be no higher freightage. It would be less.

As it was now possible to produce peat commercially at a price much lower than that of coal, it would be a great pity to allow other nations to be the first to work it on a proper scale. The British peat was, as shown by a number of analyses made by him, superior in all respects to European and other peats, and now was the time to produce a new home industry.

Neglected Art of Map-making.

MR. A. R. HINKS, secretary of the Royal Geographical Society, president of the Section of Geography, devoted his address from the chair to map-making. He began by saying that the science of his subject had made a notable advance, but the art had suffered a lamentable decline since the heroic days of Saxton and Hondius and Norden, of Mercator and Blaeu. As he was speaking in Southampton, he desired to pay a special tribute to the name of Alexander Ross Clarke, whose genius had adorned the city.

The progress of invention had placed new and beautiful methods in the hands of sur-

vveyors. There seemed unhappily to be something in self-government that was antipathetic to map-making. Our Crown Colonies were getting pretty well provided with maps, thanks in great measure to the work of the Colonial Survey Committee which had been so active in the early part of the century, and which, it was to be hoped, had not been a casualty in the war. But our self-governing Dominions had not much to boast of. As a bad example he might mention that when the Union of South Africa wished to make a small relief map to be shown at Wembley last year, they had sent round to the Geographical Society for material and had found to their horror that Natal had never been mapped. He believed that there was still not a single topographical sheet to be bought of Australia. Canada, however, had now a first-rate geodetic survey and the beginning of a good topographical map.

Although he hoped to see an effort to carry out stereographical surveying on geographical scales, he was doubtful if the photographs should be taken, at least in the first instance, from the air, as seemed to be contemplated by the advanced school and taken for granted by the newspapers. Air photography had made a brilliant success in the war, when the cost was not too rigidly scrutinised. It had done its best work in France, but required a pretty close plane table survey of well-marked points to give it a rigid skeleton. In the East it had also done well, but perhaps on the ground that any sort of patchwork mosaic was a great deal better than nothing at all.

After discussing other technical details of cartography, Mr. Hinks turned to the art. Colour, he said had been used in engraved maps from the very first, and in his opinion the most agreeably coloured atlas ever published was the Rome edition of Ptolemy of 1486. But that was hand-coloured. In the years that followed the colour became more elaborate, but had been largely in the ornament, and the essential outline of the map was in black from the single engraved plate. In modern colour lithography outlines of different classes were distinguished; blue for rivers, brown for contours, red for roads, and so forth. The resulting improvement was conspicuous in the representation of relief. Layer colouring was a method in which the British had always excelled. The supreme example of layer-colouring was the colour scale attached to the report of the Paris Conference of the 1/1,000,000 map in 1913, a scale which we might be proud to believe had been printed in England, he thought at the War Office. On

the other hand, modern methods had lost the richness of tone in the black outlines printed from the old engraved plate, and it was to be hoped that by some invention this perfection might be restored to the modern colour maps.

Another defect that had to be remedied was the writing of the names on the maps. The present method of type-writing was ugly, inefficient, and the invention of a machine for writing names on maps was urgently required. A great deal of change would have to be made before we could reach the beauty of the old maps. But that result was not to be reached by deliberately mediæval or archaic methods.

Plea for Empire-grown Timber.

The present and future supplies of timber formed the subject of a paper read in the Botany Section (Forestry Sub-section) by MR. ALEXANDER HOWARD, who said that unless some method of replanting was adopted the world in the not distant future would be faced with a serious deficiency of timber. Vast stretches of pine and larch forests had been razed to the bare ground in England. Where little ash there was was eagerly sought after for aeroplane and motor-car work. Oak was disappearing. In no part of the world was a substantial effort being made to restore supplies. More should be done to encourage the use of Empire-grown timber. Railway companies who before the war used hard woods, which could be obtained within the Empire, now imported German, Russian, or Polish oak. American mahogany or black walnut. Recently one railway had issued a demand for American walnut "sawn by American women in America." Home producers were hit by railway rates, for it cost as much to bring timber to London from a spot 80 miles away as it did to bring it from America.

Electro-plating.

In the Chemistry Section, MR. E. A. OLSBY of Manchester, read a paper on the resistance to corrosion of electro-deposited chromium. He described tests made under both laboratory and service conditions. He said chromium plating was found to be specially suitable in cases where an article was required to be bright without cleaning. It developed a high polish and in that condition resisted corrosion even better than in the unpolished state. But a single layer did not form an efficient protection for an easily corrovable material such as steel, and the most satisfactory plating for all-round purposes was chromium plated with nickel as an underlying metal. Chromium plating would prove of great use for domestic purposes, especially under present-day conditions, when the servant problem required cleaning should be cut down to its minimum.

New Premises for the Midland Bank, Ltd., Pall Mall.

These new premises are being built on the site of the old Guards' Club, and the existing branch of the Bank. The front and back are carried out in Portland stone with a Mansard roof of green slates. The sub-basement, basement, and ground floor are being occupied by the Bank.

The banking hall, which is 21 ft. high, will be lit with a large ornamental ceiling light in the centre of the building, and finished with a walnut dado and plaster panelling above. The whole of the fittings will be carried out in walnut in keeping with the usual practice of the Bank. Waiting and interview rooms will be provided on the ground floor, and a notable feature will be the provision of special rooms, close to the strong rooms, where customers may inspect their valuables and securities.

The third, fourth and fifth floors are being finished as two flats, one overlooking St. James' Park, and the other Pall Mall. These flats are being carried out in keeping with the rest of the work. The third floor will contain the hall and reception rooms, which will all be panelled. The fourth floor will contain bedrooms, and the fifth floor, which will comprise kitchens and servants' quarters, will be fitted with the latest modern appliances. Two electric passenger lifts will serve the offices and flats.

The general contractors are Messrs. Hall, Biddall & Co., Ltd., and the following are some of the principal sub-contractors:—Stonework, Messrs. F. J. Barnes, Ltd.; carving, Mr. Alfred Buxton; concrete reinforcement, Messrs. British Reinforced Concrete Engineering Co., Ltd.; lifts, Messrs. The Express Lift Co.; heating, Messrs. Rosser & Russell and Messrs. Henry White & Co.; hot water supply, Messrs. Burn Bros.; electric light, Messrs. Bell Bros.; decorative plaster, Messrs. G. & A. Brown; ornamental ceiling light, Messrs. The British Challenge Glazing Co., Ltd. The architects are Messrs. Whinney, Son & Austen Hall, F.F.R.I.B.A.

The SS. "Otranto."

Two water colour drawings recently on view at the Royal Academy Exhibition afforded some evidence of the luxury of the public rooms to the new 20,000 tons Orient liner ss. *Otranto*. Delicacy and refinement, without the loss of the broad architectural line, are indicated in both the drawings of the first-class dining saloon and smoking room. The former, of which we give an illustration, is a spacious and well-lighted saloon, its soft varying tones of grey giving prominence to the character and treatment of the Classic architecture.

The well of the saloon is a feature of much interest; square fluted columns, broken to the wall pilasters to give scale and relief, are carried up beyond the low portion level to the ceiling line of the deck above, and have carved capitals crowned with a low relief frieze, and finished with a carved cornice. Ranged between the columns, and separating the well from the surrounding

gallery, are panels of silhouetted figures in the form of bronze grilles portraying stories based on Greek mythology.

The entire floor is covered with "Rubroleum." The design is on broad lines and executed in three colours, the general scheme being to give the full benefit of length and breadth as well as harmony to this saloon. The dining saloon and the remainder of the first-class public rooms and the special cabins are being carried out in accordance with the designs and under the direction of Mr. A. N. Prentice, F.R.I.B.A.

The general contractors are Messrs. H. H. Martyn & Co., Ltd., of Cheltenham. Messrs. A. B. Burton, of Thames Ditton, are responsible for the casting of the figured bronze grilles, from the special models prepared by Mr. Richard Garbe, the sculptor. The electric fittings are being executed by Messrs. Harcourts, Ltd., from designs prepared by Mr. Walter Gilbert. The "Rubroleum" floor is being supplied and laid by Messrs. Korkid & Rubroleum Tile Co.

Brancepeth Miners' Welfare Building.

Occupying a site of two acres, this building consists of three blocks, the central one comprising billiard room, gymnasium, reading room, library, games room, meeting rooms, &c., with a single-story caretaker's house on one side and a group of slipper and spray baths on the other. The eastern block comprises an assembly hall, &c., with a total accommodation on main floor and balcony of 600. The west end block provides a large plunge bath in a suitable building, and advantage is taken of the fall in the ground from north to south to provide for the sloping floor of the main hall and the necessary fall to the bath. The total estimated cost of the buildings and the lay-out of the grounds is £18,000. The architects, who were awarded first place in a limited competition for the work, are Messrs. Hays & Gray, A.A.R.I.B.A., of Wingate, Co. Durham, and North Shields.

Some Recent Domestic Work.

Two recent houses by Messrs. Baillie Scott & Beresford are illustrated this week. The house at Crockham Hill has walling of 2 in. brickwork, and the roof is of sand-faced tiles. The half-timber work is in English oak. The contractors are Messrs. G. E. Wallis & Sons, of Maidstone, Kent.

In the case of the house at the University Botanical Gardens, Cambridge, the manner of the early nineteenth century has been adopted because it seemed most appropriate in the Botanical Gardens, where the house is placed as the terminal feature in one of the main vistas. The walls are whitewashed brickwork and the roof of slate. The contractors were Messrs. Arthur Negus & Sons, Cambridge. Casements by Messrs. George Wragge, Manchester.

House at King's Norton, near Birmingham.

This house, shown by a drawing that was on view in this year's Royal Academy, has been built for Mr. Leslie Wilmot, from the designs of Mr. J. A. Swan, F.R.I.B.A. It is placed on a hilly site, overlooking the golf links, and is planned to suit the requirements of the client. A feature has been made of the staircase hall, which goes through two floors. The accommodation on the first floor includes three bedrooms and a maids' room. The mantelpieces and fittings were designed by the architect. The materials used are: Kenilworth bricks (2½ in. broken-colour, wire-cut, with wide joints), the tiles being Rosemary, sand-faced. The contract price, including the garage, was £1,340. The work has been carried out by Mr. W. Jackson, of Langley Green. The sub-contractors were as follows:—Sanitary fittings and grates and Eagle combination range, Messrs. Parker, Winder & Achurch, Birmingham; locks and door furniture, Messrs. Walker & Worsey, Birmingham; mantelpieces, Mr. G. Furness, Birmingham; casements and leaded lights, Messrs. W. & J. H. Oldaker, Smethwick; electric light, Mr. W. H. York, Birmingham; paint, Messrs. Mander Bros., Wolverhampton.

Birkenhead War Memorial.

This memorial has been erected in Hamilton-square on a site directly facing the Town Hall,

from the designs of Professor Lionel B. Budden, M.A., A.R.I.B.A. It consists of a simple rectangular cenotaph, flanked by flagstaffs 45 ft. high, and set upon a paved plateau. The main body of the central monument 25 ft. high, is built of Portland stone, and on its longer sides, above a strongly moulded base, are panels of green Westmorland stone bearing the names of 1,293 Birkenhead men who died in the war. On each of the two narrower sides is a female mourning figure carved in relief of green Westmorland stone, enclosed within an architectural frame. Mr. G. H. Tyson Smith was responsible for the sculpture of the figures, panels, for the carving and lettering on the cenotaph, and for the modelling of the flagstaff bases. The building contract was carried out by Mr. Joseph Davies, of Birkenhead, Messrs. H. A. Clegg & Sons, of Chester, being sub-contractors for the masonry, and the Liverpool Artificial Stone Co., Ltd., for the steps and plateau. The flagstaffs were supplied and fixed by Messrs. A. Rutherford & Co., Ltd.

Deaf and Dumb Institution, Spring Bank, Hull.

The commission for this building—which is now in course of erection—was won by Messrs. F. J. Horth & H. Andrew, A.A.R.I.B.A., in a limited competition. The accommodation provided includes a meeting room to seat 30 persons, lecture hall on the amphitheatre principle seating 120, billiard and reading and board rooms, and missioner's residence. Messrs. Lawrence's sand-faced multi-coloured bricks and tiles are being used for the facing and roofing, Bewerley stone dressings being introduced for the windows. Steel casements and leaded lights are being fixed, the joinery throughout being in Austrian oak and paving in Terrazzo and Biancola. The contractors, Messrs. Vince Knowles & Sons, Ltd., who are also responsible for the brickwork and joinery, have carried out many important jobs in Hull during the past 40 years. The masonry is being executed by Messrs. Quibell & Son, Ltd.; the tiling by Messrs. Dawber, Townsley & Co., Ltd.; plumbing by Mr. C. F. Procter, and the painting by Mr. A. Christopher. The steelwork is being supplied and erected by Messrs. King & Co., Ltd., and Messrs. Samuel Butler, Ltd., Stanningley. Messrs. Rosser & Russell, Ltd., Leeds, have been entrusted with the heating and ventilation. Messrs. Morris & Co., Ltd., Warrington, are to supply the steel casements and leaded lights, and the mosaic marble and Terrazzo will be by Messrs. The Art Pavement and Decorations, Ltd., London.

Extension of the Shirehouse, Norwich.

We published last week the winning design in this competition, by Mr. A. Dunbar Smith, F.R.I.B.A. In this issue we illustrate the selected design, by Mr. Herbert Langford, F.R.I.B.A., and Mr. F. Richardson, A.R.I.B.A. associated architects. In their report to promoters the architects state that it is proposed to construct the building of brickwork and stone dressings, as used in the elevations of adjoining Shirehouse. The internal walls will be of brickwork, floors of reinforced concrete hollow block construction, roofs slated to harmonise with the adjoining buildings, partially constructed of concrete flats and natural rock asphalt finish.

"Doone House," Winchmore Hill.

This house has been erected from the designs of Mr. T. Elson Hardy, Lic.R.I.B.A. The house is multi-coloured, hand-made, sand-faced and roofing and hanging tiles are also hand-made and sand-faced.

The work was carried out by Mr. J. Weston, M.I.Struct.E., with the following sub-contractors: tiling, Messrs. John Williams; sanitary fittings, Messrs. Mellowes & Co.; leaded lights, Messrs. Walter Gibbs & Sons; and Messrs. William Morris & Co. (Westminster) Ltd.; joinery, Messrs. Duncan Tucker & Co., Ltd.; bricks, Messrs. W. T. Lamb & Sons, Leeds Fireclay Co., Ltd.

PHILIP WEBB AND HIS WORK—IX

By W. R. LETHABY.

A WINTER IN ITALY, 1884-5.

In 1880 reports reached England of a large "restoration" scheme in progress at St. Mark's, Venice, the glorious building which Morris called "a work of art, a monument of history, and a piece of nature." The recently formed Society for the Protection of Ancient Buildings organised meetings of protest, and the newspapers gave the question a publicity which they would hardly have accorded to similar doings at home. I still have some memory of the anxiety and excitement, especially the controversy about levelling the mosaic pavement which "undulated like the sea." Our sometimes clumsily expressed, interfering interest was at first resented in Italy, and English residents in the country reported the irritation felt there. Among Webb's papers I find a copy of a letter dated May 12, 1882, addressed to Signorina Bella Duffy, Florence, which explains that: "The S.P.A.B. is only concerned with the welfare of the infinitely valuable ancient monuments, and is absolutely free from any mercenary bias. I am in hope that this spirit will in time be appreciated by the Italians and other nations, and that all suspicion of motives will die out as the increase of communion between nations does away with the fear which is bred of ignorance. I should be glad if, in your intercourse with cultivated Italians, you could impress upon them that we in England would be sincerely glad if they would familiarise themselves with our monuments and help us with forcible expression from their side when the intelligent English are hard pressed while striving to save what remains unfalsified in their own land."

When recovering from a severe illness in 1884, Webb was ordered to have rest and a change. He decided to spend the winter in Italy, where Fairfax Murray and Middleton arranged to meet him.

He wrote from Florence to Mr. Jack: "I got away really on Sunday, the 9th [November, 1884], and have come through Dover, Ostend, Bruges, Ghent, Brussels, Basle, Lugano, Como and Milan to this place. . . . I have seen many fine things, mostly in a state of decay, but many of them quite beautiful and exciting—perhaps too much so for me, for I feel rather like a fish out of water, wanting the support of my daily work which has become so much of a habit to me that I do not feel at home without the stay of it. This feeling may perhaps go off, and I may get more elastic in mind and less strained in it."

The following notes are taken from his sketch-books:—

"November 10. *Bruges*. The Virgin of Van Eyck: the best work possible. The carillon of the belfry, three Mozarts and a Gounod; the hour-tune of a Mozart's Sonata. Memling triptych at the Cathedral—in best condition and altogether to be remembered.

"November 13. *Ghent*. Van Eyck's Adoration of the Lamb—unmentionable! St. Michael's Church still whitewashed. The Cathedral they have begun to play the devil with. . . . Heard good music and double diligent vespers: extra singers on screen: organ good tone." Here he drew the old dragon vane on the belfry, noted the noble oak roof of the Butchers' Market and the curved plan and whitened walls of St. Nicholas Church and visited the Beguinage.

"*Brussels Picture Gallery*—St. Sebastian by Stuerbout, remarkable anywhere, so wonderfully good that it looks like a greatest master. Who was Stuerbout? Portrait of Charles the Bold by R. Vander Weyden. Lord! what wonderful flesh. Portrait 6 x 9 inches called school of Dürer—might be an Erasmus by Holbein and is certainly by a first-rate painter. Two first-rate little tall

portraits of Philippe le Beau and Joanna of Castile: good condition, perfect pictures; foregrounds of admirable natural flowers; wings of Van Eyck, Adoration, low in tone, very perfect work; beautiful altogether, and seemingly quite untouched. Royal Library. Extra-

FIG. 1.—SCULPTURE, SIENA, DRAWN BY PHILIP WEBB.

ordinary vellum view of Seville, George Hoffnagel 1573, minute excellence astonishing.*

"Night of 17-18, *via* Strasbourg to Basle. Saw many of the old Swiss houses, very sober, useful, dignified and even beautiful. Got to *Lugano* late in the afternoon, four inches of snow on Swiss side of tunnel, but out on Italian side splendid bright sunshine without snow. Here first sight of Italian campanile. Hotel *Lugano*, [Fairfax] Murray at night. November 19. Saw the Church of Sta. Maria and Luini's great picture about 30 ft. x 40 ft. Must be nearly perfect in all ways—touched me more than I thought any picture would.

"*Como*, Duomo interesting but not to compare with the Broletto, good sound thirteenth-century brick and stonework. Towers of walls fine, five- or six-angled up-standing things of great size.

"20th to *Milan*. Duomo much as I expected, not over interesting: piers of nave fine in a way. Sculpture always good; some of glass pleasant. San Maurizio very good. Brera, with loads of noble pictures; most to me were the Luini's and the Gentile Bellini's. But I was even less touched than I expected. Sant Ambrogio is still the wonderful old church, but has been barbarously used of late years. Surely an Atrium is of all things the right entrance for a Church in a City.

"November 24. *Florence*. Saw San Miniato to-day: all wonderful in spite of some (much) damnable mutilation and smartening."

* Some drawings of Spanish cities by Hoffnagel (?) at the Victoria and Albert Museum are not so well known as they should be; some others are at Hampton Court.

Visits to Pisa, Pistoja, Siena, Orvieto followed, and Rome was reached on January 1, 1885. Here Webb settled down for a month making drawings to keep the home working with Mr. George Jack's help; and exploring the city and neighbourhood. Excursions into the Campagna with Middleton have been especially delightful, for he often talked of them in later years. February he was in Assisi; Perugia, Arezzo, Florence, Bologna, Ravenna followed; then Venice, Padua, Verona, Brescia and Milan. Figs.

FIG. 2.—NOTES AT SIENA.

somewhere between 7 and 10 o'clock on evening. P.W."

Webb's impressions of Italy are recorded in his letters to George Boyce, the architect, and to the Faulkners, which are to fill a separate chapter. Here I will give some account of his meeting and close friendship with Signor Boni, then an architect and later a distinguished scholar and protector of the monuments of his land.

When Ruskin was in Venice in 1876 he made friends with Giacomo Boni, and according to the *Life*: "His (Boni's) letters to me show how much the young architect valued the books, sympathy, and help of the English writer. He entered new life, he says, in first reading the books; his principles of architecture were to be founded on Ruskin's teaching. The enthusiasm of this architect interpreted 'restoration' as destruction, very pleasing to Ruskin."* Boni was, of course, well known to Fairfax Murray, who was working for Ruskin in Venice, and it was probably he who gave Webb an introduction to Boni, who was employed at this time on the works at the Doge's Palace. In Webb's sketch-book—following a note, "Venice, March 16 [1885], School of S. Rocco: Perhaps one of the most splendidly dismal buildings in Europe"—is written: "Signor Boni, of Works at the Ducal Palace." Webb has shown the Palace, St. Mark's, and other things by Boni, and a friendship was established between them which lasted until Webb's death. Nearly twenty years later Webb recorded in a letter: "That was good luck, the olding at Wells. Something like mine at the Ducal Palace."

While I was writing this, it was announced in the *Times* of July 8 that Commendatore Boni was hopelessly ill from an attack of cancer, and this was followed in a few days by notice of his death. Born in the Cadore district, St. Mark's day, April 25, 1859, he became draughtsman in the office of the director of restoration of the Ducal Palace. "He taught himself Greek, Latin and English, the order that he might read Ruskin, for whom he always had the greatest admiration." He wrote some articles criticising the methods of restoration, and was dismissed but taken back. Further articles in the *Bullettino di Roma* attracted the attention of the Emperor, who gave him employment in reporting on the monuments of Apulia. In 1898 he was put in charge of the exploration of the ruins. "The skill which he showed in discovering earlier remains without damaging

later buildings was most remarkable. It was his ambition to make both the Forum and the Palatine places of beauty as well as of archaeological interest, and it was his particular pleasure to heal the scars of excavation by the help of Nature. Boni was a great archaeologist, of almost uncanny powers, a real genius who by character and industry possessed himself of profound erudition—a poet and a philosopher. . . . He gave himself no peace if the beauty of mountain, lake, or river was ever threatened."

Without making extravagant claims, it may be said that there was much of Ruskin and something of Webb in all this; and as Boni's letters will show, the ideas of Ruskin and the Anti-Scrapers were after all caught up and then admirably applied in Italy.†

After Webb had left Venice, Boni wrote:—

"Duc. Pal., May 6, 1885. I got your letter, a very fond one, quite like you. . . . I recollect me of the few hours I spent with you. An unconscious sadness which I felt when you went away softens down into a fond recollection of all you said, your voice, your look, &c., coupled with an intense desire of seeing you again very soon. . . . The purpose of my journey to Rome was that of preparing the ground for our new law of protection of those monuments which, being the property of private people or separate communities, have been under no control whatever until now. The good mason whose new house we saw together asked me whether any detail of the drain pipes which you mentioned to him may be found. . . . Repeating again and again my thanks for your kindness to me. . . . Ever gratefully yours, Giacomo Boni."

In this same year Boni sent Webb a piece about the size of a brick, of one of the oak piles from the foundation of the Campanile, as hard and heavy as a fossil, and on December 15, 1885, he wrote a letter beginning "Dear Amico for I am you with a warmer love than I can express." In another letter he speaks of "Professor Middleton, the dear and learned man." Webb had another illness in the autumn of 1887, and on hearing of it Boni wrote: ". . . You will recover soon and take a long rest here as you deserve after a laborious life, and we will build a little Sandolo with a pointed sail of a dark yellow colour and its upper part darker, like the wings of a

*Through Boyce's friendship with a French painter living at Vézelay the S.P.A.B. principles were explained in France, and Herr Muthesius transmitted them to Germany. The Society has not been without honour save in its own country.

swallow, and we will go to Torcello and touch with our fingers the basketwork of the eleventh-century capitals and see how the crystals of the Greek marble glitter. . . . In the *Riforma*, our leading Roman paper, I fought hard for the law to protect ancient monuments which has been voted by our Parliament just now." To this letter Webb replied:—

To Signor G. Boni. December 21, 1887. By the hand[writing] of my friend and colleague [Mr. George Jack] I send you a few words in answer to your delightful letter of December 14. It was my greatest surprise during the time of my sickness, as I had almost forgotten everything else than a bed and a sick fool in it. I am better now, and able to think of your rhapsodic idea of the lagoons and Torcello. It was good of you to chime in with my present sentiment, which is almost childish. Your notes on what you and others have done towards saving for a more reasonable generation some small fragments of beautiful things done by a less foolish generation demands my respect. Go on as long as there is breath in your body. After I left Venice with Sig. Murray I stayed a day and half in Vicenza, and after having been made melancholy by the skilful but dismal skill of the great Palladio I turned to the beautiful bits of mediæval work. Your photograph of the Casa Nigafatta interests me greatly, though, of course, the renaissance had already begun to tell disastrously on the imaginative work of the Middle Ages. If you can get your 20 plates together of these remains I and my friends shall be glad of copies at 20 f. each. You may put down the following as subscribers for which you will hold me responsible [16 copies]. The pamphlet on 'Ca' d' Oro' interests me exceedingly. I hope shortly to become a human being again and able to do something for myself once more.

Boni to Webb, May 19, 1888. "Ten years ago I wrote a passionate paper which no Venetian journal cared to publish. Some parts I published in 1882, being my first utterance on the subject of monuments. Your letter set me to think. . . ."

June 8, 1888. "The papers sent to me by the S.P.A.B. are very interesting. While reading, I worked out what seemed to me general principles, of which I am in search in order to prepare a law for the preservation of monuments in Italy. . . . I feel what I owe to the help and encouragement of those

Ruskin as quoted in the *Life* spoke of him as 'our Boni.'

FIG. 3.—BYZANTINE CAPITAL, DRAWN BY G. BONI.

FIG. 4.—BYZANTINE CAPITAL, DRAWN BY G. BONI.

friends who contributed to develop my views on the subject of monuments. If I could tell you what has been done for the good cause your benevolent eyes would express satisfaction for having not been mistaken when you chose me for your friend."

May 9, 1888. "I have been called to Rome as architect of the General Direction of Monuments—the most noble of occupations to look after beautiful noble old buildings. . . . I should feel grateful for the statutes of the Soc.P.A.B. I want your wise word and suggestions. You will know that among those who would be disposed to agree upon and follow them none is more affectionate to you than, yours ever, Giacomo."

June 1, 1890. " . . . I am knee-deep in a grammar of Roman construction, workmanship, materials, mortars. I am surveying the ruins of villas in the Campagna, where I find types of extraordinary beauty. . . ."

In another letter he refers again to "the beauty and importance of the types of Roman masonries which I have the good luck to discover." In 1893 (March 29) he speaks of "the information which I had collected about the works of the Roman marmorarii at Westminster." In another letter he says: "I am reading with interest an account of the Rolls Chapel [a royal building c. 1250 successfully destroyed in London] which Hebb sent to me."

In answer to a question about Byzantine capitals in Rome signed with monograms, Boni wrote as follows, illustrating the letter with two exquisite sketches (Figs. 3 and 4).

"Ministero dell' Istruzione, Rome, March 19, '94. My dear Webb, monograms abound at Parenzo and Ravenna; some are also to be found at St. Giuste di Trieste. I did not succeed as yet in my researches at the Mattei Palace because the present landlord, an American, does not allow anybody to cross the threshold—but I found a capital of the sixth century and of the same type at S. Clement, together with another one resembling that of Parenzo, and bearing the inscription MERCVRIVS PB. (Mercurius a prior of S. Clement, was elected pope under the name of Giovanni II in the year 532.) Before the end of March I will start for the terra d'Otranto, and thence (from Brindisi) to Constantinople, stopping a few days in Athens. I hope to be back towards the end of April, a little less ignorant perhaps, or a little more presumptuous, according to Minerva's or Sophia's influence. You will be, I hope, by that time in as good health and as brisk as possible, jumping from one branch to another of Gray's Inn trees, twittering or chirping like the feathered inhabitants of my hermitage, to the great bewilderment of your fellow citizens. George Wardle has not written to me from Posilippo. Sartorio sent me on your letter to read. William Lethaby will be so patient as to wait till I have a free entrance for the Mattei Palace! Hearty thanks to Micklethwaite for the interest he takes in the study of the types of ancient masonries. Ever yours aff. [?] Mousiobigio."

May 16, 1894. " . . . The arches resting on the columns of the *Statio Annonæ* (now S.M. in Cosmedin, or Bocca della Verità) are decorated with modelled stuccoes which, from the analogies they present with those of S. Sebastian (fourth century) seem also to be of the age of Constantine. . . . The cornices and arches borne by small columns of stucco which decorated the apsis of S. Ambrogio, Milan, have been demolished thirty years ago supposing they were barocchi. They contained 85 per cent. of chalk (gesso or sulphate of lime), a little lime and brick powder. The bold stuccoes of S. Maria Cividale (eighth to tenth century) show that the tradition was not lost. The Austrian archaeologists seem to be unable to understand that the stuccoes of Parenzo are pure sixth-century work and not seventeenth. I should like to know whence is derived the word *stucco*—from the Arab?

The FIRST FLOOR Plan

Plans of Proposed House for Curator, University Botanic Gardens, Cambridge
MESSRS. BAILLIE SCOTT AND BERESFORD, Architects.

Later he wrote from Athens.

"Dear Philip, I examined nearly 300 fractures of the marble blocks forming the cellas of the Parthenon, &c., and found them to be produced only by the rusting of iron cramps. . . ."

In 1897 he tells that "the circular Roman tombs were usually crowned with battlements. I found traces of these over the cornice of Cecilia Metella. . . ." Again he writes of the mosaics of the Baptistery of Naples (early sixth century): "Stags drinking, each from a separate river, and sheep eating the flowering grass illuminated with gold: palm trees with pecking birds on them, the blue background of unsurpassable colour. . . . A band decorated with peacocks and fruits on a gold ground."

December 31, 1897. He describes his planting-out work in the Forum. "Over 2,000 rose trees with acanthus, oleanders, junipers, ericas, &c." Other letters speak of "my nightingales," which he really seems to have known personally, and his own garden and roses. Again, he describes the Lion of St. Mark.

January 12, 1898. " . . . Wardle came. Norton is much pleased to know you met his father [Prof. C. Norton]. . . . Monreale was something archangelic. I had a long conversation with one of the archangels in mosaic of the apse who has a lovely late Greek face, like Mrs. Stilman's, and was sorry to have to come down the scaffolding. . . ."

The latter goes on to speak of the Classic Arab flora. "The superiority of the Arabo-Byzantine flora derives from the nobility of its aspect and from the oldness of its genealogies and the myths which they originated. . . . In the Arabic mosaics we notice the palms, citrons, pomegranates and aloes."

At Agrigentum he observed "traces of

original plaster, thin as a sheet of paper, to be found in many of the flutings of columns and of the foldings of the drapery of fragments of the sculptures—still amazingly smooth."

"As to the Aurelian walls of Rome ought to make it understood that some of them only belong to the period. There are remains of the time of Tiberius with filling masonry, and Aurelian built with great care using any material that might be got by tearing down old buildings. . . . and the ruins of the Goths and of early Byzantine type." A few years later Commendatore visited England and saw Webb once more.

BOOK REVIEW

Small Country Houses of To-day. Vol. I.
By R. RANDAL PHILLIPS, Hon. A.R.
(Country Life.) Price 25s.

This volume maintains the high standard of the preceding volumes. The houses illustrated are of a larger type than those in the previous issues, and the styles are varied. The object of the book, the editor remarks, is to draw the attention of the public to the study of modern work; an admirable object, some of the old houses to which additions have been made possess a charm which only brings about. That these modern examples improve when the materials have weathered and the gardens matured there is no doubt that those who build to-day have a structure which many of the old ones cannot possess, and so necessitate continual patching. It is difficult to select any particular house for special mention, as all the examples are so well proportioned, and built of materials suitable to the sites on which they are placed.

ARCHITECTS' & BUILDERS' INQUIRY BUREAU

glad to give questions and answers, but cannot
responsibility for contributed replies, especially on
letters.

appeal to our correspondents to submit their
on paper of a size easily filed, and written as
is possible, or, better still, in typewriting?—ED.

Horse-power Required for a Pump.

[REPLY TO AQUA, AUGUST 14.]

Let W be the weight of water required
ft per second, in pounds weight; H the
to be lifted, and E the efficiency of the
as a percentage, then the H.P. required is
to $W \times H \times 100$. H is in feet.

550 × E. STATO.

File and Go of Stairs.

[REPLY TO PITCH, AUGUST 14.]

The rule used by your correspondent is
upon the rough assumption that the energy
led in lifting the weight of the body
is twice that used in propelling the body
d, so that twice the rise added to the go
ents the same energy as a step forward
same total amount. Therefore, to make
mbing of the stair easy, this should be equal
average normal step forwards, viz., 23 in.
ERGO.

Mahogany.

[REPLY TO COLLECTOR, AUGUST 14.]

It is quite possible that the wood that
ling your correspondent is African walnut,
has a very similar grain to mahogany.
gure produces dark lines upon the surface
board. As a matter of fact, the wood is
rarely met with.

MERCHANT.

Sand-Lime Bricks.

[REPLY TO MR. RICHARD ANDERTON,
AUGUST 14.]

If Mr. Anderton will write to me I will
in all information on the above subject.

THOMAS DAWBER,
The British Brick Co., Ltd.,
Philpstoun, West Lothian.

Cleaning Porcelain Enamel Bath.

[REPLY TO "R.P.B.," AUGUST 14.]

One tablespoonful of liquid ammonia
e gallon of water forms a suitable cleansing
ion for this and other purposes. Apply
a broad brush, rub, rinse and leather off.

JOHN M. FIFE.

Well under House.

[REPLY TO "WATER."]

Your correspondent might satisfy him-
by consulting the authorities at the
gical Museum, who, being informed as to
osition on the map and the depth of the
would be able to assure him of the likeli-
of the well tapping a good water-bearing
. As a matter of fact a good, deep well
not fail except after an unusual period of
ht, and the failure often occurs some
after the drought has been broken and
the new rains have percolated through
deep strata.

ve several times called on, or corresponded
the Curator of the Geological Museum in
n-street, W., and have never failed to
e the most valuable and courteous advice,
have no doubt your correspondent would
ally well received.

"AQUA."

Shuttering.

[REPLY TO "R. M. P."]

For boxes for pre-cast concrete work
found that a coating of soft soap has
ery successful in coming away clean
e concrete when set. For the larger
such as for a concrete floor cast *in situ*,
nothing so good as a good thick coat of
te.

"PRACTICE."

A Girder Question.

[REPLY TO "F. G. J."]

SIR,—I have never tried the following method,
but have had it recommended by a firm of
structural engineers, and have made a mental
note of it for use on the first possible occasion:—

Calculate the safe load to be carried, and
select two girders, each of half the required
total strength. Chase the flanges back and
front into the wall so that the girders can be
erected and placed with their webs tight on to
the wall faces; the piers at either end must
be thickened out wide enough to form a bearing
for the girders, which are now in their per-
manent positions. Over the girders cut out
for and insert short lengths of light R.S.J.
crossing the girders at about 18 in. to 24 in.
centres, and well pin in with slates in cement.
When the work has thoroughly set, open up
the work under as required, and the whole job
will have been done without any temporary
dead shoring or needling.

"INTERESTED."

Hard Tennis Court.

[REPLY TO F. P. MERRIT.]

SIR,—One of the most important parts of a
hard court is the foundation, which should con-
sist of a good bed of clinkers, boiler ashes or
broken slag laid to a thickness of at least 6 in.
and well rammed and rolled to a level surface.
The turf and vegetable soil should, of course,
have been first removed and the ground under
well rolled. The surface can then be finished
with asphaltic limestone laid on in successively
thinner and finer coats to the number of three.
Each layer should be independently rolled and
consolidated. Another surfacing material con-
sists of porous clay burnt in kilns to an even
hardness; and again, crushed brick, grouted in
cement, has been used with success. As far as
I am aware the permanent green finish is a trade
secret, and in any case I should recommend your
correspondent to consult a specialist firm to carry
out the entire job.

DEUCE.

Insect Nuisance.

[REPLY TO "ANXIOUS."]

SIR,—Since the inquiry published under the
above head in your issue of July 24, I have met
with the problem of cleansing a particularly
verminous house and have found quite satis-
factory results by the use of formalin and
permanganate of potash for fumigating pur-
poses, reinforced with constant sprayings of
strong formalin. The local Medical Officer of
Health claimed that this treatment would
destroy eggs as well as live stock, but we found
definitely that was not the case, and a series of
four fumigations at seven-day intervals had to
be carried out before all sign of life had been
destroyed. The treatment needs patience and
perseverance to bring success, and the failure of
the first fumigations should not give cause for
doubting the treatment. In the case I am
quoting we went to the length of removing all
skirtings and picture rails and window boards,
and the plugholes were found to be the favourite
nesting places. We also drilled all the plaster
ceilings to allow the floor spaces to be thoroughly
fumigated. All this means expense, but it is
quite impossible to grapple with this nuisance
by any half-measures.

X.

Dry Rot.

[REPLY TO "ANXIOUS," AUGUST 28.]

SIR,—The virulence of the dry rot fungus is
often underrated. Although germinating in
and feeding upon wood, it can penetrate into
brickwork and pass through joints or up the
walls of a building between plaster and brick-
work, obtaining nutriment from the joists, &c.,
or other timber it finds in its path. Your
correspondent will find it useless to renew

infected wood without treating the walls to
kill the fungi. The best means of doing this is
to remove all woodwork (*i.e.*, skirtings, &c.),
and all plaster for a distance of at least 12 in.
from the new timber, and burn the exposed
wall surface with a blow lamp. The walls
should be replastered with Portland, Keens', or
other hard cement or plaster, and all new wood-
work built in should be generously treated with
creosote or other wood preservative. This will
prevent any fungi returning and attacking the
new wood. Of course, all new work must be
well ventilated, or the trouble will start again
in the timber.

JOHN C. F. JAMES.

SIR,—The most important point is to take
away every possible vestige of dry rot and
destroy same. The fungus left in the joints of
brickwork should be burnt out with a very
powerful blow-lamp or, better still, an oxy-
hydrogen burning plant. The joists and the
underside of the flooring should be treated with
at least two coats of one or other of the many
wood preservatives advertised. See that the new
wood contains no sap of any sort. Look
also to ventilation.

G. W. HARRIS.

Roofing Felt.

SIR,—Can you tell me whether the bituminous
roofing felts are superior to the hair felts for an
under lining to a slate or tile roof?

CLIMATE.

Cold Water Supply.

SIR,—I am running a lead cold water service
in a trench by the side of some heating pipes.
The trench will be permanently sealed. Do you
consider it safe to leave the pipe unwrapped as
it runs by the side of a heating-pipe? The job
is a school.

QUERY.

Wind-Driven Plant.

[REPLY TO P. E. STEPHENS, AUGUST 14.]

SIR,—I have a "Ventimore" installed which
has given great satisfaction in regard to efficiency
in low winds. It is particularly good in winds
estimated at from 7 to 10 miles.

WILL E. MORUNT.

Tiles Splashed with Cement.

SIR,—We have had several inquiries recently
from customers who have had machine-made
tiles on sills, &c., splashed with cement and
mortar stains. These discolorations, having
been allowed to dry and remain some months,
are difficult to remove. Could any of your
readers suggest some preparation that would
be effective in restoring the normal appearance
of the tiles?

"CEMENT."

Provincial Architect's Practices.

SIR,—I recently came upon a practice in a
certain office which appears to be most irregular.
The case in point is this:—

A bill of quantities is prepared by an architect
who acts as his own quantity surveyor. In
the "Painters Bill" a provisional sum of £200
is provided. The architect received a fee of
2½ per cent. on this amount. When the build-
ing was half-completed a bill of quantities of
"painting work" for the same building was
prepared and put out for tenders. At the end of
the bill the contractor was required to provide
the sum of 2½ per cent. for quantity surveyor's
fees.

Now, the architect acting as his own quantity
surveyor receives 2½ per cent. twice over
for the same work. I should like to know if this
is the general practice of architects in any
district.

ALBERT C. FREEMAN.

THE BUILDING TRADE.

SETTING OUT A STAIRCASE

On Paper.—To the beginner in design the setting out of a staircase will present one of the main difficulties of his design and, as the experienced designer will know, it is a matter to which very careful consideration must be given at an early stage in the operations as so many other matters depend thereon.

Having decided upon the relation of the stairs to the rooms, into which the matter of aspect and lighting will enter, the main requisites will be directness and a saving of passage space. So far as aspect is concerned in a domestic building, where it is naturally desired that as many as possible of the living rooms should face the sun, it will be obvious that the staircase will be relegated to another side of the building;

quotient being the number of risers; e.g., if the height from floor to ceiling is 8 ft. and the thickness of plaster ceiling, floor joists and floor boards, 9 in., together these equal 105 in. so that $\frac{105}{7} = 15$ risers.

The next step is to mark off on a vertical line extending from floor to floor corresponding to the story-rod 15 divisions, for which the following is a rule of thumb method quickly executed. Lay the scale at an angle so that the figure 0 on the scale coincides with the lower floor line and the figure 15 with the upper floor line, and tick off on to this diagonal line the numbers 1 to 14, when lines drawn parallel to the bottom floor line from 1 to 14 will give, where they cut the vertical line, the risers in

alternately by the use of the T-square for treads and T-square and set-square for risers, until the flight from lower floor to landing is completed. The upper flight may then be finished in the same manner working upwards from the landing, the outer edges of the landing continued upwards for a height of 7 in. being the first riser from the landing or the 15th in the stairs.

From this skeleton section so formed, the plan may be completed and its relation to the floor space, doors, &c., on both floors studied. Where another staircase is desired above the section, it should be worked out in the same manner, in order that the necessary headroom may be obtained and its effect upon the plan discovered before the other details of the plan are filled in. In upper flights where they come under the roof it is always advisable to design the stairs so that the topmost flight follows the rake of the roof, but where headroom is not possible dormer windows cut in the roof will supply this.

Where winders occur (though showing in their actual position in plan) on the skeleton section they will appear merely as vertical spaces left vacant, the first rectangular tread starting from above the line of the outer edge of the landing at the height of the mark, indicating the top winder.

Setting out a Stair in the Shop.—In the actual construction of the stairs in the shop a story-rod is used which corresponds to the vertical line on which the heights of the risers were marked off on the drawing. In the same way the heights of the risers are set out on the

LAYING OUT A STAIR

ON PAPER

DOTTED LINES SHOW ALTERNATIVE STAIR WITH WINDERS.

SHOWING USE OF STORY-ROD

and whilst a view is desirable at all times, it will not be of such importance from the stairs as from a living-room or bedroom. But lighting, on the other hand, is a matter of the very first importance, though one so often overlooked. Wherever possible a staircase should have at least one outside wall on all landings and galleries, and the largest windows possible in the space should be provided; also portions of sash windows should be hung to open to provide ventilation of a space that will otherwise very soon become stuffy, especially in houses. Top-lights in the form of skylights are better than no light, but are best avoided wherever possible, and are only of use over staircases where there is an appreciable well between the flights.

While a staircase should have at least one outside wall, to be most effective it should be so planned that it lands at a point as near as possible to the doors of the principal rooms on that floor, thereby saving space in passages.

Method.—The position of the staircase having been decided upon, it remains to plot it upon the plan, and the method employed involves the simultaneous consideration of the plan and section. If, for example, a stair having a tread of 9 in. and a riser of 7 in. be taken, the number of risers is found by dividing the height of the rooms plus the thickness of the floor by 7, the

equal heights, 0 being the lower floor and 15 the upper. In actual draughtsmanship it will save time if the vertical line chosen be the outer wall of the stairs, and if it is an open newel stair with a landing, at least 3 ft. from this wall to its outer edge should be provided at a height giving suitable head-room. A distance of 3 ft. may then be marked off from the outer wall at the height chosen, and from that point distances of 9 in. which for expedition in drawing it will be found convenient to set off in distances of 3 ft. subdividing into four subsequently. It should be borne in mind that the top step of each flight being the surface of the floor or landing, consequently the number of treads will always be one less than the number of risers, so that if the landing is at the height of 12 risers, 11 treads will require to be marked off from the outer edge of the landing. This will give the flight from the landing to the lower floor. As a time-saving method the depth of landing and 11 treads of 9 in. may be ticked off from the scale laid along the line of the upper floor, in which position they will not be hidden from view by the T-square in completing the flights, but the risers may be drawn down from them by the use of the set-square. Starting, then, with the outer edge of the landing as the 12th riser, the remaining treads and risers may be drawn

story-rods by means of compasses, the proportion of tread to riser having been determined by any of the methods already described. The story-rod is first marked on the works with the distance from floor to floor by being dropped vertically down the face of the trimmer to the floor below to a point directly under it, obtain by means of a plumb-line and bob. The point which the floor boards on the upper floor cut the story-rod is then marked on the story-rod which is now divided equally by means of dividers into as many divisions as there are risers shown on the drawings. The top one is then marked "Up," and the side of the rod which these divisions figure is marked "Rise." The rod is next laid against the plaster of the end wall, if the wall is rendered, or 1 in. allowed if it is not, and the distance from the end wall to the trimmer position is marked on the other edge of the rod. The position of the first riser is also marked on the rod, and should be lettered "Start." The position of any openings for doors or windows should also be marked.

From the story-rod, the heights of the risers are marked on the inner faces of the strings on a line drawn $1\frac{1}{2}$ in. from the bottom edge of the strings and parallel to it.

The next process is to get out a template known as a "pitch-board," for laying out the form of the steps on the strings. This template is shown above in the form of a right-angled triangle, having a base the width of the tread and a height the same as that of the riser. The pitch-board is then laid on the string with its longest side along the line, marked 12

up from the bottom edge and with the side of the same length as the tread, touching the point marked from the stair-rod, the third side giving the face of the riser.

An alternative form of pitch-board is that shown in section below. On the bottom edge of this is fixed a strip of the same width as the margin, and another strip is tacked on at right angles to act as a gauge for the pitch-board, to enable the correct angle of the lower edges of the rise and tread mortices to be marked on the string. It might be thought that the simplest method would be to mark out the tread and riser at right angles; but, as the mortice has to be of wedge shape to take the wedging at the back of the treads and risers, the angle

between the two mortices makes 98 degs. instead of 90 degs. For use in conjunction with these, two other templates are required, the one—the riser template—being the length of the riser, and its width plus the space required by the wedge; the other, the tread template, having similar dimensions. These are then laid on the single lines marked on the inner faces of the strings from the pitch-board, and a line drawn round them gives the actual dimensions of the chase mortices into which the treads and risers are to be housed and wedged.

The length of the string may be estimated by multiplying the longest edge of the pitch board by the number of steps, adding the distances necessary to meet the skirtings or return strings, though it is advisable to leave an additional length for cutting and fitting on the works. The illustration shows the method of cutting the string to fit the floor and skirting.

A more rough-and-ready method of laying out the steps on a string is by the use of the steel square on which the inch marks corresponding to the depth of tread and riser are placed against the line parallel to the bottom of the string.

Laying Out Winders.—When winders occur at the bottom of a flight they are laid out in the following manner. One leg of a compass is placed at the outside end of the last rectangular riser and the other leg opened out to 14 in. and a curve described between the point where it

LAYING-OUT WINDERS-1

puts the last rectangular riser and the bottom riser at right angles thereto. This curve is then divided into three equal divisions, and through these points lines are drawn from the centre of the curve to the wall string. These lines give the risers of the winders.

To lay-out the wall strings to take the winders they are measured from the fourth riser to the third, the distance between the points where the fourth and third risers cut the wall string on plan. One leg of a compass is placed on the angle of the fourth tread and riser, and the other leg to the top edge of the straight string. An arc of the same radius is then described from the point of intersection of the tread and riser No. 3 with the string. A tangent to the two arcs gives the top edge of the string, and a line parallel to

this and at a distance sufficient to take the second tread gives the underside of the string.

To obtain the short string on the wall at right-angles to the main flight to take the first riser and part of the second, draw riser 1 at a point where it cuts the string and do the same

with riser 2, making the distance between them equal to the width of the first winder and the distance from the top of riser 2 to the string equal to that portion of the second tread which is carried by this string. The height from this intersection of the second tread with the string to the top of the string should be made equal to the height of the point of intersection of the wall string described in the last paragraph to take winder No. 3.

Risers around Cylindrical Openings.—The ends of well-holes between flights are often terminated in a cylindrical curve around which the winders are formed. By this means the narrow ends of the winders are prevented from coming to an actual point, as when grouped round a central newel. Considerable work will be saved by their correct arrangement in the construction of the strings and rails.

Where there are several risers around the cylinder the chord of the last rectangular riser should be so placed as to come 2 in. below this chord, as shown. Where a cylinder is placed either at the top or bottom of a staircase, and contains several winders, the one next the landing should be placed at least 2 in. within the cylinder, when the remaining winders should have their risers radiating at equal distances apart from the centre of the cylinder.

WINDERS ABOUT A CYLINDER

Where the cylinder comes at the intersection of two flights leading from a half-space or level landing, the diameter of the cylinder should equal the width of the treads, and the risers should be in the springing.

(To be continued.)

THE BIRMINGHAM BUILDING EXHIBITION

THE Birmingham and Midland Building and Allied Trades Exhibition (including Public Works and Road Making Section) is to be held at Bingley Hall, Birmingham, from September 7 to 19. The Exhibition is one of the most important of the year to be held in the Midlands, and it presents an excellent opportunity for the display of building trade products to architects, builders, and others interested in the subject throughout the huge area which comprises the Midland Counties. We shall publish a comprehensive survey of the Exhibition in our next issue, but in the meantime it will be of interest to give some general idea of the wide range of its appeal. The Exhibition has for its President the Right Hon. the Lord Mayor of Birmingham (Alderman P. Bower, M.B.E., J.P.), and there are twenty-three vice-presidents, all gentlemen who are intimately and prominently associated with the industry in the district, in official, professional, or business capacities. It is organised by the Birmingham Chamber of Commerce (Incorporated), 95, New street, Birmingham, under the patronage and with the support of the Birmingham Architectural Association, the Midland Federation of Building Trades Employers, Birmingham Association of Building Trades Employers, Birmingham and District Master House Builders' Association, Birmingham and District Master House Painters' Association, Birmingham and District Builders' Merchants' Association, Birmingham Association of Master Plumbers, Birmingham and District Master Gas Fitters' Association, the Electrical Contractors' Association, Birmingham Civic Society, the Clerks of Works and Building Foremen's Association, Birmingham Tame and Rea District Drainage Board, the Institution of Civil Engineers, the Midland Counties Builders' Merchants' Association.

The exhibits will comprise building materials, builders' ironmongery and hardware, architectural and ornamental work, constructional steel work, ferro-concrete, sanitary apparatus, appliances and fittings, contractors' plant, shop, bar and restaurant fittings, municipal engineering and equipment, paints, varnishes, colours, enamels, stains, polishes, lacquers, metal powders, wood preservatives, glues and adhesives, mechanical and hand painting and spraying apparatus, decorating materials, wallpapers and coverings, electrical, gas, oil, and other illuminating and heating plant and fittings, road-making plant and materials.

The efficient organisation of the Exhibition is assured. The members of the committees are all prominent in trade and business circles, and it need only be recalled that the staff who are responsible for the success of the British Industries Fair, Birmingham, are entrusted with carrying through the arrangements of the Exhibition, with Mr. G. Henry Wright as Secretary, and Mr. Charles Stanley as General Manager. The venue chosen is well known. Bingley Hall is situated within a few minutes' walk of the Town Hall, Post Office, railway and tram termini, and is very spacious and well-lighted, with ample accommodation for visitors.

A series of conferences is being arranged, at which addresses on technical subjects of interest to the industry will be given by well-known people. In this connection it is proposed to erect a special Conference Pavilion in the Minor Hall, which will provide for the comfort and convenience of visitors.

Messrs. Herbert Nicholls, Ltd.

We are informed that Mr. Guy Herbert Nicholls, the managing director's eldest son, has been elected a director of Messrs. Herbert Nicholls, Ltd., public works contractors, in place of Mr. D. B. Tanner, who has resigned in his favour.

CLAIM FOR HARD CORE

Building Trade Custom Set Up as to Payment.

In the Mayor's and City of London Court, before Deputy Judge Frank Hinde, a claim was recently made by the P. & S. Road Materials Transport, Ltd., hard core merchants, 26, Shaftesbury-avenue, Piccadilly-circus, against the Suburban Developments (London), Ltd., Finsbury Pavement, E.C., for £52 15s. 4d., for hard core supplied. Mr. Basil Tod-Jones was counsel for the plaintiffs, and Mr. G. Granville Sharp represented the defendants. Mr. Jones said the Court would be troubled with one point in the case which had been commenced by a specially endorsed writ in the High Court on February 16 last, by which date all the orders had been given, the goods supplied and the prices accepted. In the affidavit, in answer to Order XIV proceedings, sworn by Mr. Green, secretary of the defendant company, he said that at the date of the issue of the writ the time for payment of the plaintiffs' account had not arrived. The affidavit went on to state: "The defendant company are builders, and by custom of the trade, payment for goods was made on the 20th of the month following delivery. Of the amount claimed by the plaintiffs, £30 9s. 1d. was not due for payment until February 20, and the balance would not become due until March 4, when they were ready and willing to pay the account." The defendants, counsel said, had persistently refused to make any offer, or to pay the costs on the ground that the plaintiffs had issued the writ prematurely. The plaintiffs' answer to the custom of the trade was, in the first place, that so far as they knew no such custom existed. In the second place, if it did exist it did not bind the plaintiffs because they were not builders. And even supposing it did exist, and was binding upon the plaintiffs, there was a special agreement made with the defendants as to the time for payment of the account. He (counsel) proposed to prove the special agreement, and leave his learned friend to prove his custom of the trade. Mr. C. T. Payne, called for the plaintiffs, said he was the founder and managing director of the plaintiff company. About the middle of January a telephone conversation took place between him and Mr. Batchelor, of the defendant company, with regard to payment of the account and the terms arranged were for payment of cash against invoice. Deliveries of material commenced about January 20, and he made many attempts to get into telephonic communication with the defendants with regard to payment of their account. He was not successful until the month of February, just previous to the last delivery, when Mr. Batchelor, who came to the phone, said he would please himself about payment. Upon that, instructions were given to their solicitor to issue a writ. Later, during the correspondence, defendants stated that they would pay the account by the end of the month, which was afterwards altered to the 20th of the month. Witness said that business consisted mainly of the supply of hard core for road-making purposes, and they could not in any sense be called builders, or builders' merchants. There was a separate trade called the hard core trade, and there was no custom, in the absence of special agreement, to pay accounts on the 20th of the month following delivery. Cross-examined, witness admitted answering an advertisement on September 29 for the supply of hard core, and quoting 5s. 3d. per cubic yard, which was accepted by the defendants, who required delivery to start about October 12, of approximately 16 to 20 yards per day. In dealing with the defendants plaintiffs thought they were public works contractors. Plaintiffs dealt with builders as roadmakers, but not as builders. There was delay in getting cash against delivery because it was not known the exact amount of material on the lorry. Mr. Percy Triplett, manager to the defendants,

said on September 30 he gave orders to the plaintiffs for the supply of 200 yards of hard core at 5s. 3d. per yard. There was no question of terms of payment discussed at any time with him. He had been in the building trade 20 years, and he was familiar with the custom as to payment of accounts which was to pay at the end of the month following delivery of the goods, unless there was a special arrangement. Evidence in support of the defendant's contention as to the custom of the trade was given by a number of witnesses.

The Deputy Judge, after hearing the evidence, said it was perfectly obvious that judgment must be entered for the plaintiffs. There was only one defence and that was that there was a custom which provided that payment of accounts like the present need not be made until the 20th of the month following delivery, or as was now stated, at the end of the month. The question before him was, was there such a custom between people occupying the relationship of the plaintiffs and defendants in that case that accounts should not be paid until the end of the month? He was of opinion that the evidence did not establish such a custom at all. He did not think it would be sufficient to establish a custom in the building trade. The witnesses were by no means unanimous. The majority, however, were agreed that between builders' merchants and builders there was such a custom. The plaintiffs had abundantly made out their case. He thought in a matter of that sort the writ should not have been issued in the High Court, but in the County Court. There would therefore be judgment for the plaintiffs with such costs as were provided by the County Court scale.

COMMERCIAL CREDIT RISKS

EXPORT CREDITS AND CREDIT INSURANCE.*

This little volume deals with a subject which from the Introduction appears to have been suggested by Mr. Samuel the Parliamentary Secretary to the Department of Overseas Trade, in a speech delivered last January before the Leeds Chamber of Commerce. Mr. Samuel appears to have said that whether the facilities for export credits now in existence would be continued remained to be seen, but to have invited the Chambers of Commerce to express an opinion whether a system of overseas credit insurance against default by the buyer should the buyer be unable to meet the bill when due, for reasons that he had lost his money because of bad trade, or because the exchange had given way, or a revolt had taken place, or war had broken out between nations, would be a practical idea, in which case he would approach the Chancellor of the Exchequer with a view to seeing whether the Department of Overseas Trade, for a premium, could take the war risk off the shoulders of the insurance companies.

The Department since this speech was delivered has issued a questionnaire to the Chambers of Commerce, banks, and other trade associations, which will be found in this volume, and the author, who has had many years' experience of this very complex subject, has presented his views in this volume trusting that it may assist those concerned in evolving a scheme. Seeing the highly technical subject dealt with in these pages we can do little more than inform our readers where full information on the subject can be found. The author deals with the various stages through which the subject has developed and refers to the experience in the United States, and comes to the conclusion that the existing schemes of insurance here have been, and are,

* By A. H. SWAIN, Fellow of the Corporation of Insurance Brokers, Chairman, City of Leicester Electricity Commission; Member of the East Midlands Electricity Advisory Board. (London: Sir Isaac Pitman & Sons.) 1925. 5s. net.

so limited in their scope that little can be expected from them so far as overseas trade is concerned, but in his last chapter he formulates what he terms the "outlines of a scheme designed to meet the manifest needs of the commercial community." To do more than present such a scheme in outline he says would be an absolute impossibility.

We must refer our readers to this chapter for full information, but we may reveal the fact that the author considers that mutual insurance affords the only possible basis for a scheme to insure against the risks in question. The work is written in an attractive style and deserves the attention of all who are interested in this question.

"SUNDEALA" WALLBOARD

Messrs. G. D. Peters & Co., Ltd., of Caxton House, Westminster, are exhibiting a variety of their specialties at Wembley, including a number which have a particular interest for architects and builders. Chief among these is the "Sundeala" wallboard, a synthetic colloidal material which has many uses in connection with building, though it is especially suitable as panelling for walls and ceilings. It is homogeneous and, as we have been able to test for ourselves, possesses great rigidity and strength as well as marked fire-resisting qualities. It can be bent to a radius in manufacture, and is thus especially suitable for internal or external angles or for providing coves to ceilings and such-like purposes. It requires few battens in erection, and its use thus ensures a reduction of labour and material costs. The makers claim for the material that it will not warp, blister, or split under changing temperatures, and that it is unaffected by heat, damp or cold. The process of manufacture gives the finished product the ability to reject moisture instead of absorbing it, therefore it retains paints of all kinds, distemper, varnish, etc., and maintains a perfect finish, however treated. One side is flat and smooth, providing an excellent surface where delicate or polished effects are desired; the other side is canvas-finished, and is suitable for the panelling of dining-rooms, studies, offices, halls, etc. The material is easily cut and is supplied bent to shape, if required. It is made in sheets of two sizes: 11 ft. by 4 ft. 6 in. and 8 ft. by 4 ft. It can also be supplied in sheets 11 ft. by 2 ft. 3 in. and 8 ft. by 2 ft. embossed and decorated in the following designs:—Tile for bathroom, kitchens, corridors, etc.; oak grain, seal, crocodile, baby crocodile, and antique leather grains for panelling dining and billiard rooms, halls, lounges, cafés, etc. Messrs. G. D. Peters & Co. are also manufacturers of equipment for railway carriages, motor cars, omnibuses and tramcars, and mobile electric welders, and specimens of these products are all on view at Wembley.

Kelvin Hall, Glasgow.

The Glasgow Corporation Special Committee has decided to recommend the acceptance of an offer by Sir William Arrol & Co. to erect a new Kelvin Hall. The estimated cost of the building which will have a glazed roof of three spars girders, is £162,115. The front elevation is to be of stone, others of stone facings with rough cast back, and floors of concrete, making practically a fireproof structure.

Houses in Renfrewshire.

Plans passed by the Upper District of the Renfrew C.C.: 46 houses, Commercial-road Barrhead, Paisley; Messrs. Lennox & McMath 103, Bath-street, Glasgow, are the architects three dormitories, one isolation pavilion, an maids' home at Mearns Sanatorium, Mearnskirrk for the Glasgow Corporation.

Glasgow Mains.

The Electricity Department of the Corporation are to carry out expansions of mains, at a estimated cost of £90,140, for winter relief work.

NEW BUILDINGS IN LONDON.

Ashted Park.—Improvements and extensions costing £8,000 are being made to the house and stable block at Ashted Park for the City of London Orphan School Committee. The builders are Messrs. Cropley Bros., Ltd., Church-road, Epsom.

Becontree.—A site on the London County Council's Housing Estate at Becontree has been purchased by the Co-operative Wholesale Society, Ltd., 99, Leman-street, E.1, for new buildings, which will be designed by the Society's architect, Mr. L. G. Elkins, F.R.I.B.A.

Bermondsey.—A new Employment Exchange is to be erected in Bermondsey, under the supervision of H.M. Office of Works, Storey's Gate, S.W.1. The contractors are Messrs. A. Roberts & Co., Ltd., 74, Earl's Court-road, W. The steelwork will be supplied by Messrs. Somerville-Barnard Construction Co., Ltd., Archangel Works, S.E.

Brook-street.—Two West-End residences are to be erected in Brook-street, W.1, by Messrs. E. D. Winn & Co., Ltd., 32, Lowndes-street, S.W.1.

Chelsea.—Messrs. Rice & Son, 15, Stockwell-road, S.W.9, are erecting a new wing of three floors at the St. Mark's College, King's-road, Chelsea, S.W.3, costing about £40,000. Messrs. Beazley & Burrows, architects, 17, Victoria-street, S.W.1.

Denmark-street.—A new building, consisting of offices, etc., is being erected in Denmark-street, W.1, under the supervision of Mr. Walter J. Fryer, Walmer House, Regent-street, W.1.

Deptford.—New shop premises are being put up for Messrs. Mitchell & Son at 20, High-street, S.E. The builder is Mr. W. Figg, George-row, S.E.6. The architects are Messrs. Purvis & Purvis, 417, New Cross-road, S.E.14.

East Ham.—East Ham Hospital Committee hope to collect the necessary funds this year to enable a start to be made on the building of their new hospital of 66 beds. Messrs. Mennie & Smith, A.R.I.B.A., architects, 11, Newcourt, Lincoln's Inn, W.C. Mr. Joseph Rookwood, F.S.I., quantity surveyor, 25, Bedford-row, W.C.

Eltham.—Plans by Mr. J. A. Emes, 21, Surrey-street, Strand, W.C.2, for shops and showrooms on a site at the corner of High-street and Grove-yard, Eltham, for Messrs. Furlongs, Ltd., have been approved.

Enfield.—Alterations and improvements, including a new hot-water heating apparatus, are to be carried out at the Infirmary at Chase Farm Schools, Enfield. Mr. J. C. S. Mummery, A.R.I.B.A., architect, 34, Bloomsbury-square, W.C.1.

Fenchurch-street.—Messrs. F. Keen & Son, 469, Old Kent-road, S.E., are pulling down old premises on a site in Fenchurch-street, E.C., prior to the building of a six-story office and shop block. Messrs. Richardson & Gill, architects, 41, Russell-square, W.C.1.

Gray's Inn-road.—It is proposed to expend £50,000 upon extensions at the Royal Free Hospital in Gray's Inn-road, W.C. Messrs. H. V. Ashley & Winton Newman, architects, 14, Gray's Inn-square, W.C.1.

Grosvenor-gardens.—A new branch of Messrs. Lloyds Bank, Ltd., is to be established in Grosvenor-gardens, S.W.1. The alterations are to be carried out by Messrs. Trollope & Colls, Ltd., 5, Coleman-street, E.C.2.

High Holborn.—The British Bureau, of 19, Abingdon-street, S.W.1, has acquired the large block of buildings at Nos. 95-99, High Holborn, W.C., and 14-17, Eagle-street,

where it is proposed to erect a new building called "Monomark House."

King's Cross.—The London and North-Eastern Railway Company are to convert a large granary at King's Cross, N.W.1, into a goods warehouse. Plans by the company's engineers.

Lambeth.—A new building, to cost about £58,000, is being erected at St. Thomas's Hospital, on the Albert Embankment, S.E.1, to provide accommodation for students and staff. Mr. H. W. Currey, F.S.I., architect, 37, Norfolk-street, Strand, W.C. Messrs. Sabey & Son, contractors, 100, Great Russell-street, W.C.1.

Leighton-road.—A scheme has been submitted to the authorities for the rebuilding of the "Gloucester Arms" public-house at 61, Leighton-road, N.W., at a cost of £8,000. Plans by Mr. Malcolm T. Saunders, architect to the owners, Messrs. Watney, Combe, Reid & Co., Ltd., Stag Brewery, Westminster.

Lombard-street.—Old buildings are being pulled down in Lombard-street, E.C.3, by Mr. Nelson Wise, contractor, Henshall-street, N.1, preparatory to the erection of a large office block. Messrs. J. Campbell Jones, Son & Smithers, architects, 9, Dowgate-hill, Cannon-street, E.C.4.

Maidstone-street.—Mr. Samuel A. S. Yeo, A.R.I.B.A., Bank-chambers, St. John's-street, E.C.1, has prepared plans for the rebuilding of the public-house, "Britannia," in Maidstone-street, E., for Messrs. West's Brewery Co., Ltd., Hackney-road, E.2.

Oxford-street.—The premises at No. 100, Oxford-street, W.1, owned by Messrs. F. & C. Osler, Ltd., electric light fittings manufacturers, are to be rebuilt, to plans prepared by Messrs. Constantine & Vernon, 82, Mortimer-street, W.1. The contractors are Messrs. Bovis, Ltd., 43, Upper Berkeley-street, W.1, and demolition is being carried out by Messrs. J. Ashton & Sons, Stoke Newington-road, N.16.

Piccadilly.—A large block of shops, showrooms and offices is to be built on the site at the corner of Piccadilly, opposite the Ritz Hotel, W.1. Messrs. Treherne & Norman, architects, Windsor House, Kingsway, W.C. Messrs. Griggs & Son, builders, 100, Victoria-street, S.W.1.

Plaistow.—The King Edward's Hospital Fund for London have considered a scheme for the extension of St. Mary's Hospital for Women and Children at Plaistow. Messrs. A. Saxon, Snell & Phillips, architects, 9, Bentinck-street, Manchester-square, W.

Putney.—The Putney General Hospital at Lower Common, S.W.15, are raising funds for the building of a new wing, at a cost of about £10,000. Messrs. Young & Hall, 17, Southampton-street, W.C., have prepared the plans.

Queen Victoria-street.—Alterations are to be made at the General Post Office buildings in Queen Victoria-street, E.C.4, to plans prepared by H.M. Office of Works, Storey's Gate, S.W.1.

Regent-street.—A commencement has been made on operations in connection with the rebuilding of Les Gobelins Restaurant in Heddon-street, Regent-street, W.1. The contractors are Messrs. James Smith & Sons, Ltd., South Norwood, S.E.25. Messrs. Nicholas & Dixon-Spain, F.F.R.I.B.A., architects, 19, Hanover-square, W.1.

Regent-street.—A start has been made upon the rebuilding of the premises in Regent-street, W.1, of the International Fur Company. The builders are Messrs. Hall, Beddall & Co., Ltd., Waterloo-road, S.E.1. Steelwork by Messrs. H. Young & Co., Ltd., Nine Elms Ironworks, S.E. Messrs. Henry Tanner, architects, 3, Hanover-square, W.1.

Regent-street.—Good progress is being made in the rebuilding of premises in Regent-street

and Vigo-street, W.1, for Messrs. Austin Reed, Ltd., outfitters. The contractors are Messrs. W. F. Blay, Ltd., of Dartford, Kent, and Dowgate Hill, Cannon-street, E.C.4. Steelwork by Messrs. Moreland Hayne & Co., Ltd., 80, Goswell-road, E.C.1. Messrs. P. J. Westwood & Emberton, architects, 7, Adam-street, Strand, W.C.

Richmond.—Alterations and additions are to be carried out to the shop premises of Messrs. Charity Bros. in the Quadrant. Mr. E. J. Partridge, F.R.I.B.A., architect. Messrs. Soole & Son, contractors, Dunstable Works, Richmond.

Rotherhithe.—A new office building is to be erected for Messrs. H. J. Enthoven & Son, Ltd., at Rotherhithe-street, S.E.6, to the designs of Messrs. J. Moir, Kennard & Sons, 13, Railway Approach, London Bridge, S.E. The contract is being carried out by Messrs. Galbraith Bros., Ltd., 63, Waterloo-street, S.E.5.

St. John's Wood-road.—A public garage, with a number of lock-ups, is to be built on a site in St. John's Wood-road, N.W. The contractors are Messrs. P. W. Kirkman, 134, Green-street, Forest Gate. Steelwork by Messrs. Girder Frameworks, Ltd., 31, St. Paul's-churchyard, E.C.4. Mr. J. S. Stewart, architect, St. Paul's-churchyard, E.C.4.

Shoreditch.—Various conversion works are to be executed at the St. Leonard's Hospital in Hoxton-street, N.1, for the Guardians of the Parish of St. Leonard. Mr. F. Danby-Smith, F.R.I.B.A., architect, Parliament-mansions, Victoria-street, S.W.1.

Southwark.—Southwark Borough Council have approved plans, submitted by Mr. A. Sykes, architect, 19, Fitzroy-square, W.1, for the erection of a large warehouse at the corner of Upper Ground and Bennett-street, Stamford-street, S.E.1, for Messrs. J. Sainsbury, Ltd., provision merchants.

Tooting.—Messrs. Edward Mortimer (London), Ltd., clothiers, etc., 9, New Bridge-street, E.C.4, have put in hand work upon the building of new branch premises at Upper Tooting-road, S.W. Messrs. Birdwood & Mitchell, architects, 80, George-street, Portman-square, W.1.

Tottenham.—The foundation-stone of the new hall for St. Hilda's Church at Tottenham, N., has been laid. Messrs. H. Knight & Son, builders, 16, Bruce Grove, N.17. Professor Reilly, F.R.I.B.A., architect.

Walham Green.—Messrs. Prestige & Co., Ltd., Cambridge Wharf, Grosvenor-road, S.W.1, are to build new branch premises in the Broadway, Walham Green, for the Westminster Bank, Ltd. Mr. E. Guy Dawber, F.R.I.B.A., architect, 18, Maddox-street, W.1.

Walthamstow.—A new secondary school is to be erected at Walthamstow for about 410 pupils. Mr. Jno. Stuart, F.R.I.B.A., architect, Springfield Old Court, Chelmsford.

Walthamstow.—Alterations and renovations are to be carried out at the Granville-road Schools, Joseph Barnet Schools, Forest-road and Mark-street Schools, for the Education Committee, whose architect is Mr. H. Prosser.

Warwick-street.—Foundations are being constructed for a building of shops and offices at Nos. 23 and 24, Warwick-street, Regent-street, W.1. Messrs. George Porter & Sons, Ltd., contractors, 124, Summer-road, S.E.15. Mr. F. Cubitt Nichols, F.R.I.B.A., architect, 37, Norfolk-street, Strand, W.C.

A Correction.

In our issue for August 21, under "New Buildings in London," it was stated that plans for "Marcol House" (289-293, Regent-street, W.) had been prepared by Mr. Walter J. Fryer. This was an inadvertent mis-statement. Mr. C. T. Armstrong, A.R.I.B.A., is the architect, Mr. Fryer being the client.

CAPITALISM

WE do not know whether the recent speech of Mr. A. A. Purcell, delivered when presiding at the fifth session of the British Commonwealth Labour Conference, is correctly reported, but if that is the case his industrial views appear to have somewhat altered since he wrote the Foreword to the "Waste of Capitalism," a work we reviewed in our issue of October 31 last. In his recent speech he is reported as saying that the reasons for our low exports were to be found in the stupendous industrial development in India, China, South Africa, and the subject and Colonial countries generally, and in the extension and intensification of industrial capitalism in Middle Europe, Germany, Austria, Hungary, and in America. . . . "We must now realise that the economy of the world was so highly developed, so technically efficient, and so extensive that infinitely more could be produced than could be consumed under capitalism. Every extension of capitalist industrialism—and capitalist industrialism was extending at a very rapid rate both within and without the Empire—added to the capacity for increasing the overflow of output while at the same time not increasing the powers of consumption to anything like the same degree. "The time has come," Mr. Purcell is reported as saying, "when we have got frankly to admit the failure of capitalism and to take steps to break the capitalist system and reconstruct world economy on an entirely new basis; to do that it is necessary to develop a power capable of smashing capitalism and reconstructing society."

The doctrine contained in these last words is nothing new; it savours of what has been known as Illuminism for more than a century and a half, but the failure of capitalism Mr. Purcell now speaks of is an entirely different thing from what he wrote about in September, 1924, in the above Foreword to the "Waste of Capitalism."

There we read: "There is abundant evidence in this volume to prove that responsibility for the failure to reach maximum output rests upon the employers. . . . The result of this inquiry is to throw the onus on the other side," meaning the employers. "It is shown in the plainest and most convincing manner possible that the normal operation of the capitalist system maintains production at the level at which the highest profits are obtainable by the employers, and that this maximum of production is not the highest maximum which would be normal in a system organised for production and not for profit. . . ." And again: "This report is in effect an indictment of the capitalist system. Limitation of output to maintain profits, price fixing, the exercise of monopolistic control carried to such a point that by agreement firms are paid not to produce. . . . Not only these positive checks upon output, but the failure to introduce well-tested improvements in methods, technical organisation and scientific design in workshop layouts, the continuance of unhealthy working conditions, the maintenance of long hours of work without proper provision for rest intervals, must be laid at the door of the employers. The loss of output due to causes for which the workers can in part at least be held responsible is much less than is commonly supposed. . . ." Never surely has a writer written words which have had such a surprising effect in less than a year. The obstacles to output appear to have been removed throughout the whole world, output has outstripped consumption and capitalism, "so highly developed, so technically efficient," is capable of producing far more than can be consumed under a capitalist system, and Mr. Purcell is aghast at the effect of his words. A new system, he finds, must be suggested, not increase of output but increase of consumption; but this he sees cannot be attained without the drastic remedy of smashing the whole system and re-

constructing society. Will these words have the same influence as his former words of wisdom appear to have had upon the whole world? Mr. Purcell has laid a heavier burden upon himself this time. He shows capitalism is steadily extending in every country; he shows every country is alive to the necessity of increasing output, but before he will convince the world that the right remedy for all evils is to smash everything and begin again, he will have to show what lies behind this process, and what kind of place the world he proposes, after destruction, to reconstruct will be.

A PROSECUTION UNDER THE RENT ACTS

In the *Times*, August 25, a prosecution under section 10 of the Rent Act, 1920, was reported.

That section deals with the letting of a house or any part thereof at a rent which includes payment in respect of the use of furniture, where the rent charged yields to the lessor a profit which, having regard to all the circumstances of the case, and in particular to the margin allowed under section 9, which deals with the civil remedy, is extortionate, and the maximum penalty is £100. This penalty can be inflicted "without prejudice to any other remedy under this Act," but the Court may, in addition to the penalty, order that the rent, so far as it exceeds the amount permitted by section 9, shall be irrecoverable, and that the amount of any such excess shall be repaid to the lessee, but if this course is adopted, such order shall be in lieu of any

other method of recovery prescribed by the Act. Section 9, subsection (2), defines "normal profit" as "a profit which might reasonably have been expected from a similar letting in the year ending August 3, 1914, while subsection (1) provides that it must be proved that the rent charged is yielding or will yield to the lessor a profit more than 25 per cent. in excess of the "normal profit."

In the case, as reported, the defendant was the owner of two houses in which there were nineteen furnished rooms let at various rents. In 1914 the net annual profit on the tenancies of the two houses was stated to be £142, whereas the net annual profit to the defendant, who had been the landlord since 1921, was stated to be £452 19s. 5d. Evidence appears to have been given that the rent for one poorly furnished room let to a married man and his wife and four children was 14s. a week.

There seems to have been no defence put forward, as an offer was made to refund the excess charges for the past six months. The Bench inflicted a penalty of £50 and ordered the defendant to pay £25 costs, and in addition ordered that the rent paid during the last six months in excess of the rent agreed as a fair rent, 10s., between the defendant's legal representative and the prosecuting solicitor, should be repaid.

It was stated by the defendant's legal representative that this was only the second prosecution brought under the Rent Acts (we have only recorded one previously, see *The Builder*, September 7, 1923), and he pleaded this showed public ignorance of the Act.

The Bench, in inflicting the above penalty, intimated that the system of charging exorbitant rents must be put down, but time was granted to the defendant in which to consider the question of an appeal.

NEW COMPANIES

RATES OF WAGES IN THE BUILDING TRADE

Every endeavour is made to ensure accuracy, but we cannot be responsible for errors.

The particulars quoted below have been compiled by Messrs. Jordan & Sons, Ltd., Company Registration Agents, of 116, & 119, Chancery-lane, W.C.2, from the documents available at the Companies' Registry.

HALWILL Co., LTD. (206,703). Registered June 18. Clayworkers and brickmakers. Nominal capital, £6,000.

B. WHITEHOUSE & SONS, LTD. (206,771). Registered June 20. Park House Works, Monument-road, Birmingham. Builders. Nominal capital, £30,000.

ELIANE, LTD. (206,723). Registered June 19. 23, Portugal-street, W.C.2. Builders or restorers and decorators of buildings, &c. Nominal capital, £5,000.

E. J. MEARS, LTD. (206,726). Registered June 19. 11, Great Turnstile, High Holborn, W.C. Builders, contractors, estate agents, &c. Nominal capital, £500.

BELGRAVIA ELECTRICAL Co., LTD. (206,694). Registered June 18. Adams House, 23, Old Queen-street, Westminster, S.W.1. Engineering contractors, general engineers, &c. Nominal capital, £2,000.

AMPHORA ART POTTERY AND TILE, Co., LTD. (206,691). Registered June 18. 2, Fox-court, Gray's Inn-road, E.C. Slaters, tilers, builders, &c. Nominal capital, £500.

LAYTON HALL (BLACKPOOL), LTD. (206,735). Registered June 19. Builders and contractors, &c. Nominal capital, £3,000.

GEORGE OUGH, LTD. (206,786). Registered June 22. Pucketon Quarries, Liskeard, Cornwall. Stone, rock, slate and other quarry proprietors, &c. Nominal capital, £1,000.

LONDON AND SOUTH COAST BRICK Co., LTD. (206,757). Registered June 20. Manufacturers of and dealers in bricks, &c.

ROMILEY PARK ESTATES, LTD. (207,384). Registered July 20. Builders, decorators, sanitary, electrical and general engineers, &c. Nominal capital, £1,000.

NEWCASTLE CONSTRUCTION Co., LTD. (207,380). Registered July 20. 33, Sandhill, Newcastle-on-Tyne. Builders and contractors, decorators, &c. Nominal capital, £1,000.

DORMAN LONG HOUSING Co., LTD. (207,365). Registered July 18. Zetland-road, Middlesbrough. Build houses under their steel frame systems of construction. Nominal capital, £25,000.

HEARN, ROGERS & HARTLEY, LTD. (207,331). Registered July 17. 37, St. Barnabas-street, Pimlico, S.W. Decorative and architectural plasterers, &c. Nominal capital, £2,000.

FRED. WHITAKER & Co. LTD. (207,329). Registered July 17. 20, Otley Old-road, Leeds. Builders and contractors, &c. Nominal capital, £5,000.

BUILDERS' SUPPLY Co. (CAMP HILL), LTD. (207,286). Registered July 15. Trinity Wharf, Sandy-lane, Camp Hill, Birmingham. Builders' merchants, &c. Nominal capital, £4,000.

ROWLANDS & RHODES, LTD. (207,130). Registered July 7. 8, Royston-road, Cudworth, Yorks. Builders and contractors. Nominal capital, £1,000.

W. WAGER & SON, LTD. (207,259). Registered July 14. Builders, &c. Nominal capital, £2,000.

W. H. COLT, LTD. (207,246). Registered July 13. Bush House, Aldwych, W.C.2. Builders, &c. Nominal capital, £2,500.

ARTHUR LAKE, LTD. (207,234). Registered July 13. Capel House, 54, New Broad-street, E.C.2. Roofing contractors, &c. Nominal capital, £100.

V. C. FITZPATRICK & Co., LTD. (207,205). Registered July 11. Manufacturers of and dealers in building materials, &c. Nominal capital, £1,000.

GEOFFREY MARTIN & TAYLOR, LTD. (207,223). Registered July 13. 8-9, Old Broad-street-venue, E.C.2. Manufacturers of, agents for, and dealers in cement, lime, bricks, &c. Nominal capital, £100.

CONTRACTS, COMPETITIONS, &c.

For some contracts still open, but not included in this List, see previous issues. Those with an asterisk are advertised in this number. Certain conditions beyond those given in the following information are imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in; the name and address at the end is the person from whom or place where quantities, forms of tender, &c., may be obtained.

BUILDING, PAINTING, ELECTRIC LIGHTING, HEATING, etc.

SEPTEMBER 7.—**Athlone**.—PAINTING.—Painting works, and works incidental, at Custume Barracks, Athlone. Felix Cronin, Major-General, Quarter-master-General. Deposit £1 ls.

SEPTEMBER 7.—**Croydon**.—FOUNDATIONS.—Formation of new basement floor, new engine room floor, reinforced concrete raft, and foundations for turbo-alternator No. 5, at the Electricity Works, Factory-lane, for the C.B. Borough Electrical Engineer.

SEPTEMBER 7.—**Croydon**.—HOUSES.—Erection of two houses on the sites known as 81 and 82, Welford-road, for the C.B. Borough Engineer, Town Hall, Croydon. Deposit £2 2s.

SEPTEMBER 7.—**Dublin**.—EXTENSION.—Of Parochial Schools, Pearce-street, Dublin, for the Very Reverend McNevin, P.P. J. J. Robinson, F.R.I.A.I., architect, 8, Merrion-square. Deposit £2 2s.

SEPTEMBER 7.—**Edinburgh**.—ELECTRIC LIGHTING.—Electric lighting installations in 288 dwelling houses under the Gorgie Housing Scheme, Contract No. 10, for the T.C. A. Grierson, Town Clerk. Deposit £1 ls.

SEPTEMBER 7.—**Hitchin**.—PUBLIC CONVENIENCE.—Building a public convenience near Bancroft, for the U.D.C. Surveyor's Department, Old Town Hall, Hitchin.

SEPTEMBER 7.—**Kingsbridge**.—HOUSES.—Eighteen houses at Rack Park, and laying of a 6 in. sewer and the extension of water main, for the U.D.C. J. Hole, Architect to the Council.

SEPTEMBER 7.—**London**.—KEEPER'S LODGE.—Materials required in the erection of a wharfekeeper's lodge, Chancellor-road, W.6, for the Hammersmith Borough Council. R. Hampton Clucas, Borough Engineer and Surveyor, Town Hall, Hammersmith, W.6. Deposit £1 ls.

SEPTEMBER 7.—**Newcastle-upon-Tyne**.—SECONDARY SCHOOLS.—Erection of secondary schools to provide for 1,000 pupils, subject to the sanction of the loan by the Ministry of Health, for the Education Committee. Director of Education, Education Office, Northumberland-road, Newcastle-upon-Tyne. Deposit £5.

SEPTEMBER 7.—**Pencelwdd**.—BUILDING.—Police station, for the Glamorganshire C.C. T. Mansel Franken, Clerk of the C.C., Glamorgan County Hall, Cardiff.

Twenty acres at Mid-Craigie are being purchased for the extension of the Eastern Necropolis. The City Engineer has prepared a scheme for the extension of the offices at Miln-street depot, at a cost of £450. The Markets Committee are considering the erection of new slaughterhouses on modern lines. The City Engineer is to prepare a scheme for repairs at the Meadows washhouses. Messrs. J. & E. Shepherd, on behalf of the Northern Housing Association, Ltd., has submitted a proposal for the erection of 152 houses at Thornbank and Ellengowan, the cost being estimated at from £440 to £460 each.

EAST FINCHLEY.—At an estimated cost of £6,500, the Congregational Church is to be extended.

EAST SUFFOLK.—Plans have been prepared by the East Suffolk C.C. for a nurses' home at St. Audry's Hospital.

EDMONTON.—The U.D.C. has received sanction from M.H. to the borrowing of £18,230 and £470, in respect to the new recreation ground and lay-out at Galliard-road.

FAIRSWORTH.—The U.D.C. are proposing to erect 404 houses in the next two years.

FELSTED.—A sugar beet factory is to be built at an estimated cost of about £250,000.

FESTINIOL.—Plans have been prepared by the Merioneth C.C. for a new bridge.

GLASGOW.—The Corporation have asked the City Engineer to prepare plans for a branch library on a site in Oxford-lane. The Water Committee are being asked to consider the erection of houses for men permanently employed by the water department. The Library Committee are considering the provision of a library for the Pollokshaws district. Schemes for repairs at Blackfriars and St. Andrew's parish churches are under consideration. A scheme has been prepared for the extension of the Glasgow and West of Scotland Commercial College. The pavilion at the Dalmarock Power Station recreation ground is to be enlarged at a cost of £598. The Housing Committee recommend granting the subsidy in respect of 160 terrace houses to be built by Messrs. Mactaggart & Mickel, Ltd., at King's Park.

TRADE NEWS

S. W. Francis & Co., Ltd., the Rolling Shutter makers, of 64-70, Gray's Inn-road, W.C., inform us that their workmen who went on strike some weeks ago for an advance in wages, have now been reinstated at the old rates.

We have received a copy of the latest booklet dealing with the sanitary section of Messrs. O'Brien, Thomas & Co.'s goods, a pocket edition of which has just been published under the title of "Sanitary Appliances." We would draw our readers' attention to the usefulness of this convenient size, and to the quality and reasonable prices of the goods illustrated. Those interested should apply to the show-rooms at 18, Upper Thames-street, E.C., for No. 48, Sanitary Section.

We have received a brochure from Messrs. Marshall, Sons & Co., Ltd., engineers, of Gainsborough, dealing with their Type "S" oil engines and their application. These machines are high-grade self-contained power generators, conceived on practical lines, and scientifically constructed for the economical utilisation of crude, refined, and residual oils. There is a stationary type to be used for belt driving machinery in factories, sawmills, brickyards, and other places where space and economy are considerations; the ground space occupied is small compared with that of a steam plant of corresponding power, and the foundations necessary are small and inexpensive. The portable series is suitable for contractors for driving mortar mills, crushers, mixers, pile drivers, saw benches, and other contractors' work requiring motive power. The driving principles of both types are similar, both being of the horizontal enclosed type, worked on the well-known two-stroke cycle, which is here fully explained. The combustion is so complete that no deposits are formed and the cylinder, therefore, needs very little cleaning. Another advantage is that no air or exhaust valves are required, and the trouble experienced with these is therefore eliminated. There is a specification given, together with a list of standard dimensions for both types. Those interested should apply to the London offices, at 3, London Wall Buildings, E.C.2, for particulars and price lists.

PROPOSED NEW BUILDINGS

(Continued from page 373).

GLOSSOP.—The Corporation have instructed the Borough Surveyor to prepare a design for a brick or stone building for purposes of an isolation hospital, to accommodate 24 patients and staff, for erection in sections.

GLOUCESTER.—The R.D.C. are proposing to build 50 non-parlour type houses. Application is to be made to the M.H.

GUISELEY.—The M.H. has approved of the tenders for 18 houses at Guiseley.

HALLAM.—The Conservatives in the Hallam Division of Sheffield are making progress towards the establishment of a new club for the district, and funds are being raised for this object.

HEADINGTON.—The R.D.C. are to apply to the M.H. for permission to build 24 houses on the Barton-road Headington site.

HERDEN BRIDGE.—The M.H. has given the U.D.C. sanction to borrow £2,800 to purchase the Garden-square estate, the land being required for extensions to the District Council offices, street improvements, and as a site for public baths.

HENLEY.—The D.C. has decided to erect 12 cottages on the Britwell-road site.

HONITON.—The M.H. has sanctioned the scheme by the R.D.C. for the erection of 68 houses, as follows:—Awliscombe (Wynnton), 8; Broadhembury (Cramier and Colliton), 4; Combe Raleigh, 4; Coteleigh, 4; Dunkeswell Abbey, 4; Farway, 2; Luppitt (Week), 2; Monkton, 4; Northleigh, 4; Offwell, 4; Payhembury, 2; Plymtree, 10; Salcombe Regis (village), 2; Widworthy, 2; Southleigh, 4; Broadhembury (village), 4; Awliscombe, 4.

HORSFORTH.—The U.D.C. has instructed the Surveyor to prepare a preliminary scheme for the extension of the sewage works.

HORSHAM.—The U.D.C. are to make application to the M.H. for sanction to borrow £690 for the purchase of land in Crawley-road to provide a site for a second Crawley-road housing scheme.

HULL.—The Corporation recommended the acceptance of a tender at £5,675 for the erection of a clinic for the treatment of venereal disease.

KILKENNY.—The Corporation has decided to build twenty new artisans' dwellings.

LANGWITH JUNCTION.—A start has been made with the new secondary school at Langwith Junction, which is under the Derbyshire E.C.

LONDON (BRONDESBURY).—Middlesex E.C. have acquired land from the Ecclesiastical Commissioners for erection of a secondary school.

LONDON (ST. MARLEBORNE).—The Grammar School is to be rebuilt at a cost of £44,000.

LONDON (STEPNEY).—The B.C. are applying to the L.C.C. and a loan of £5,000 to build baths on a Mile End-road, E. site.

LONDON (WALTHAMSTOW).—Ferry-lane is to be widened at a cost of £28,280.

LONDON (WANSWORTH).—The equipment of the new Technical Institute will cost the L.C.C. £15,000.

LONDON (WANSTEAD).—The Essex E.C. are inviting tenders for the erection of a new secondary school.

MIDDLETON.—On the new housing estate at Middleton a new church is to be erected by the Leeds Church Extension Society.

MORECAMBE.—The Surveyor to the Corporation has been instructed to prepare plans, details and specification for the erection of a large number of houses.

NEWMARKET.—The R.D.C. are to build 200 houses in the next three years.

NEWYDD.—Merioneth C.C. has decided to widen the bridge at Pont Newydd and the road approach on the Trafford side.

NORTH DUBLIN.—The R.D.C. are considering a scheme submitted by Mr. Sean O'Cull, on behalf of the Nua-Ghaedhtacht Committee for the building of about 100 houses.

ONWYDD.—The M.T. has approved plans prepared by the Merioneth C.C. for the reconstruction of Onwydd bridge.

OWLERTON.—Funds are being raised by the parish-ioners of Owlerton Church for the erection of a block of buildings in Forbes-road. The estimated cost of the hall is £5,000.

PANDYRODYN.—Merioneth C.C. are negotiating for land required for the improvement of the bridge.

PENISTONE.—The L.N.E.R. (Southern Section) are inviting tenders shortly for the construction of a steel bridge over Green-road widening in connection with the Penistone to Barnsley Loop Line construction. Plans, details and specification have been prepared by the Company's Engineers at King's Cross.

PINNER.—The Hendon R.D.C. passed plans: 26 houses, Parkfield-avenue, Pinner, for Neithcott & Pepper; pavilion, Headstone-lane, Pinner, for Bedford College for Women; eight houses, Manor-way, Pinner, for Headstone Manor Estates Co.; 12 houses, Priory-way, Pinner, for Headstone Manor Estate Co.

PONTEFRAC.—The R.D.C. has decided to erect an additional 38 non-parlour type houses on the Airedale housing estate, near Glasshouse.

PORTMADOC.—Portmadoc War Memorial Hospital subscribers have resolved to take steps to erect a new hospital towards which £5,000 is already available.

PORTSTEWART.—The Golf Club Committee is to erect two new club houses at a cost of £3,500.

REIGATE.—The R.D.C. has resolved to make an application to the M.H. for sanction to borrow a sum of £13,118 for 12 working-class houses at Betchworth, 6 at Kingswood, and 6 at Horley, to be erected by the Council, the amount to cover the cost of sites and buildings.

RETFORD.—The T.C. propose to carry out a scheme for the erection of 24 non-parlour type houses.

RICHMOND (YORKS).—Tenders have been accepted by the Corporation for the restoration of the Market Hall.

RISELEY.—Berkshire E.C. are in communication with the managers of the Swallowfield School regarding the improvement of the school buildings.

SCARBOROUGH.—The T.C. are considering a proposal to continue the promenade south of the bathing pool in front of the Holbeck Gardens at a cost of £8,745.

SALFORD.—The Corporation are purchasing property in Chapel-street for conversion into a showroom for the electricity department.

SCUNTHORPE.—The Scunthorpe and Frodingham U.D.C. have approved the Gas Manager's amended general lay-out of the suggested offices and stores at the new gasworks in Dawes-lane, to cost approximately £2,500, and the manager has been instructed to prepare details and obtain tenders for carrying out the work.

SEAHAM HARBOUR.—The U.D.C. has decided to have plans prepared for the erection of new lavatories near Seaham Harbour Station.—Durham County E.C. are preparing plans for an elementary school.—The U.D.C. have asked the Clerk to interview the trustees of the old Infirmary regarding the sale of the premises as Council offices.

SELBY.—The U.D.C. has decided to carry out an improvement scheme on the Flaxley-road building estate, at an estimated cost of £1,175.

SHREWSBURY.—A scheme has been enunciated by the Salop C.C. for the establishment of a hospital for twelve advanced cases of tuberculosis in conjunction with the Shrewsbury and Aitcham Joint Hospital Board's Isolation Hospital at Monkmoor, Shrewsbury, the tuberculosis shelter to be built on land adjoining the Isolation Hospital.

SKEGNESS.—The U.D.C. has decided to invite tenders for the construction of an orchestral piazza on the Grand Parade, with an up-to-date bathing pool on the sea-ward side. The estimated cost of the scheme is about £30,000.

SOUTHALL.—The Council has accepted a £13,284 tender for 28 houses.

STANLEY (YORKS).—A scheme is being launched for the construction of a bridge over the River Aire at Bottomboat.

STOWMARKET.—East Suffolk E.C. propose to enlarge the senior school to accommodate 80 more scholars, at a cost of £1,500.

SUNDERLAND.—Sunderland is to have a new deep-water quay with the necessary warehousing and railway facilities, and a special committee has been appointed to confer with the River Wear Commissioners with a view to the joint action of these bodies being taken in the matter.

SWALWELL.—A site is being selected for the erection of an elementary school for the Durham County E.C.

SWORLS.—The Balrothery R.D.C. has in contemplation a waterworks and sewerage scheme, estimated to cost £20,000.

TADCASTER.—Plans passed by R.D.C.: Twenty houses at Borrowby-lane, for J. R. Siberry; and new mission hall at Bowers-raw, Allerton Bywater, for the Trustees (architects, Garside & Pennington, Pontefract). The R.D.C. are making applications to the M.H. for sanction to borrow £48,500 for erection of 120 houses at Allerton Bywater; £29,100 for 60 houses at Micklefield; £20,370 for 42 houses at Kippax; £23,280 for 48 houses at Swillington; £5,820 for 12 houses at Church Fenton, and £11,640 for erection of 34 houses at Sherburn.

TAURLES.—North Tipperary C.C. decided to borrow the money required to provide and equip a technical school.

TOWYN.—Merioneth C.E.C. are to raise a loan of £4,500 for the purpose of providing additional accommodation at the county school.

TWICKENHAM.—The M.H. has given sanction to the D.C. raising a loan of £33,000 for alterations to York House and grounds for the use of the Council and the public.

WAKEFIELD.—The West Riding E.C. are preparing plans for the proposed public elementary school on the Portobello estate, Barnsley-road.—Plans have been prepared by W. H. H. Marten, architect, Leeds, for the erection of a new church, for the Rev. J. Ratcliffe, upon a site at the corner of Portobello-road and Barnsley-road.

WARGRAVE.—As a memorial to the men of the parish of Wargrave who fell in the war the church propose to erect a new chancel. The extension to the church is estimated to cost £7,000.

WARRINGTON.—Plans have been prepared by Messrs. W. & Segar Owen, and tenders have been accepted for the erection of a Reredos at St. Luke's Church as a memorial to Miss Ann Greenwell. The B.E. have decided to proceed with the provision of an intermediate school, rooms for practical instruction in the elementary schools, and to make application for sanction for the raising of a loan for the replacement of school property and various repairs required at the Sacred Heart School and St. Albans School. The new school is to be erected at the east end of the parish of St. Mary's.

WASHINGTON.—The U.D.C. has received sanction from the M.H. to erect an additional 62 houses on the Spout-lane site. The Council has approved plans submitted by Mr. Marks, architect, of Sunderland, for the erection, by private enterprise, of 133 houses on the estate between New Washington and Usworth Village.

WEALDSTONE.—The U.D.C. passed plans: Twenty-six houses in Whitefriars-avenue, for Mr. A. Thornborough.

WEST RIDING.—The Highways Committee of the West Riding C.C. have submitted to the M.H. a forecast of expenditure upon maintenance and improvement works for the year 1925-26, amounting to £1,178,285.—The County Council have prepared plans for widening the Cow Beck bridge at the Leeds city boundary in Abbey-road.

FIRES.

LONDON (BATTERSEA).—Considerable damage was done by fire to the premises of Messrs. Walter Carson & Sons, paint manufacturers, Lombard-road, Battersea.

OBAN.—Estimated at between £10,000 and £12,000 damage was caused by fire at the Neptune Mills.

* These prices apply to new buildings only. They cover superintendence by foreman and carry a profit of 10% on the prime cost without establishment charges. A percentage of 1½ should be added for employers' liability and National Health and Unemployment Act and from 1s. 6d. per £100 for Fire Insurance. The value of the information given on this page is copyright. Prices include both materials and labour.

NEW METHOD OF CON- CRETE CONSTRUCTION FOR HOUSES

A NEW system of concrete construction lately patented consists of casting concrete into its sired form and position, but instead of temporary supports a permanent mould is used which in itself forms an integral part of the finished structure. The mould consists of asbestos-cement sides 2 ft. 6 in. by 10 in. by 32 in. flanged throughout their length at the top and bottom, the ends of the sheets, or sides, being wiped to a radius so that similar character is preserved. The flanges provide a seating for successive courses and enable the sides to be added one to the other with metal connecting links, of which there are six—three at top and bottom. Those at the top are so shaped that they project above the top flange and provide a support for the succeeding course by allowing the bottom flanges of such course to be in contact with the projecting links. The sides and links are securely fastened together by inserting eyelets into corresponding holes and locking them.

For the purpose of constructing walls of different thickness links of different lengths are used. Where it is desired to construct cavity walls the method adopted is to replace the flat links at the bottom with twisted ones having notches sawn in them to receive legs of 24s. W.G. sheet metal arch piece, then to assemble before and insert the arch piece. All architectural and structural features are preserved by the adoption of standardised pieces.

The component members of the mould and special pieces are light and easily handled, are delivered to the site of building operations ready for assembling, and can be assembled by unskilled labour where and as required. The moulds are placed in their allotted positions on previously prepared foundations—butt ended, the special pieces being set to openings and corners, &c. The appearance of the whole then resembles a skeleton wall or continuous channel, into which is poured freshly mixed concrete. Succeeding courses are treated in a similar manner. In circumstances where cutting of material is essential, it is claimed that the use of an ordinary saw will quickly reduce any member to its desired form.

Asbestos-cement material has been used because it is impervious to climatic conditions and uninfluenced by contact with gas, &c., and is imperishable under usual conditions and in normal service required of building materials. The material in its natural colour is of pleasing appearance, and artistic effect can be obtained by the use of permanently self-toned material—such as terra-cotta red, russet-brown, &c. An important feature is that there are no joints or vulnerable points which can be attacked by the weather and so cause deterioration. We are informed that under stringent tests perfect adhesion between the concrete and the inside

of the moulds is found to be secured with no indication of air holes or other defects.

In cubic capacity one mould is equal to twenty bricks, but the assembled mould is equivalent in weight to just over one brick, from which it will be observed that ease and speed are dominant factors. Where extensive operations warrant the use of a mechanical mixer and distributor these factors assume greater importance. The economy in labour and time, it is claimed, is in direct proportion to the magnitude of building operations, and by comparison with brickwork—remembering that one mould displaces twenty bricks—the ratio appears to be as twenty is to one. Only one skilled artisan is said to be required to set out and supervise operations. He is followed by semi-skilled and unskilled labour in placing moulds and in mixing and casting concrete. Thus the number of skilled artisans can be distributed over a larger area or liberated for other operations, also a greater amount of semi-skilled and unskilled labour is absorbed. We understand that this method compares favourably with most methods and is about 22 per cent. cheaper than brickwork. For treatment of internal walls it is desirable first to apply a lining of Hessian cloth, after which papering or distempering can be immediately proceeded with. The patentee of the system is Mr. Maddock, of Elton, near Peterborough.

THE BUILDER

A JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR.

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

DL. CXXIX.—No. 4,310

SEPTEMBER 11, 1925

THE INVESTIGATION OF TIMBER DISEASES

WE have often pressed the claims of investigation which shall lead to the betterment of building, to the conservation of supplies, and to improvements which shall, by increasing the life of structures, decrease their ultimate cost. The promotion of investigations is always difficult in this country, which, in past days of Britain's trade supremacy, managed so comably on the rule-of-thumb methods of our forefathers, and specially difficult in lean years when funds, even for the necessary necessities of carrying on trade, are difficult enough to obtain. That much can be done, however, by propaganda and personal effort is evidenced by progress in certain fields which attention has been specially drawn, the importance of research in which has eventually been sufficiently impressed to produce some definite action, either officially or by private munificence or both. Recent instances of such munificence in this country are not wanting; for example, there are the gifts to the chemical department at Cambridge University of a great trading combination, and the Rockefeller bequest, aided by a substantial Treasury grant, for a coming research institution in London.

Among researches which have recently received stimulus those on the diseases of plants, more particularly in reference to conditions in our tropical colonies. The need and facilities and the aim of such researches have been ably advocated and explained by Sir Arthur Shipley in *The Times*, and one of the recent articles referred to losses due to fungi. Now, while in general have nothing to do with buildings, there are certain species of such importance where timber is concerned that a plea of research upon them should hardly require arguing, as pointed out in correspondence following the articles referred to, very little is being done to grapple with these. We refer, of course, to what is known as "dry rot," a popular designation for diseases caused by various fungi in rotting timber. Let us first try to visualise the case for investigation.

Prior to the war the value of imported timber for constructional purposes was computed at worth eighty millions, which home production must be added, and it is thus evident that the question of its preservation is no insignificant matter. We have no statistics before us, but to visualise the position, we assume our annual consumption of such timber as worth £100 millions, and that half of this goes into permanent buildings. On a life of forty years, the capital value of such material is £2,000 millions. The timber now procurable is admittedly inferior to that of past times when only well matured trees were felled. Now a very large proportion of all soft timber is sapwood. This bears on the problem, as dry rot attacks much more readily in sapwood than in heart wood, the former being of more open structure and containing nutrient starch, upon which it can feed. Again, in the efforts to provide cheap houses there is a growing tendency to use soft timber, which is not looked upon with disfavour by the authorities responsible for housing schemes, and owing to the scantlings of such timber, most of it—we had nearly said soft—is sapwood. There is yet another aspect of the case for investigation. American writers tell us that it has been found that wood infected by dry rot is more inflammable than sound timber. It has, indeed, been stated that under favourable conditions large pieces of half-rotted timber will ignite at a temperature as 290 deg. F. Here is an inducement for insurance offices to interest themselves in this problem. It may be fairly asked: "Is the disease sufficiently prevalent and widespread to justify any concerted action to prevent or reduce it?" Unfortunately the general indifference

to this plague has resulted in an entire absence of statistics on its extent, but inasmuch as the malady is known by almost every householder and cases are the common experience of everyone responsible for building structures, the extent of the malady should be sufficiently apparent. To the reader of this journal, at least, no argument on this point will be necessary.

We may therefore turn to consider what is being done to mitigate a very serious cause of national loss. The Natural History Museum possesses a department devoted to mycology, which is always ready to assist the public in identifying fungi, and which, we believe, carries out some work on dry rot fungi, but only as a small part of an enormous field covered by this science, which embraces hundreds of genera, not to speak of species which have nothing to do with building timbers whatever. The Ministry of Agriculture, which used to issue a leaflet on dry rot, but as far as we know did not engage in investigation, has discontinued this publication. The Imperial College possesses a department of woods and fibres under a teaching professor, who has made a considerable study of dry rot, but whose duties cover a very wide field of which this is merely a fraction. The Industrial Research Department, after an existence of more than a decade, and representations from the R.I.B.A. almost since its inception, has now taken up this subject, but as far as we have any information only in a limited manner.

Briefly, therefore, it would appear that we have no organization in this country which is dealing with the problems of diseases in structural timbers on a scale at all adequate to the importance of the subject. That there is much to be learnt no one will deny. As yet we cannot be told the genesis of dry rot, at what stage in the history of timber its appearance is possible, whether it is necessarily associated with certain other forms of life (as, for instance, with the presence of *Coniophora*), which seems so common a circumstance with most diseases, the exact conditions of spore germination, the limit of spore life, the most efficient fungicides, and a host of other information necessary for the retention of house timber in a healthy condition. Some excuse might be made for a lack of knowledge which is in part admittedly only obtainable by protracted research, if any action were being taken to mitigate this disease. Such action appears to be nobody's business, and the building owner, and thus the nation, suffers accordingly. The condition under which timber is stacked at our docks, where new timber is frequently piled upon decaying and infected material, is most discreditable, while many timber yards show entire disregard for the danger involved by insanitary conditions. The R.I.B.A. has recently taken up the former matter with the prospect of useful results.

Meantime the architect and the building contractor remain in a most difficult position as regards this disease. The former may usually be relied upon to provide in his construction such safeguards against damp, stagnant air, and infection as are possible, while the contractor looks to the timber merchant to sell him sound timber, but the constant actions at law show that the element of risk is always present, and it will remain present until this matter is taken up on a large scale as a serious national problem. No private person can be expected to embark on the work requisite, but if the Government were to come forward with a really adequate scheme it would be spending money which, as the correspondent alluded to remarks, would produce a very large return in the saving annually of many thousands of pounds, and surely in these days when so much depends upon adequate knowledge, one of our largest industries, in which so much public money is being sunk in connection with housing, has a right to such expert investigation.

NOTES.

Housing Progress. SPEAKING at the opening of the Building and Allied Trades Exhibition at Birmingham (which is reviewed elsewhere in this issue), Sir Kingsley Wood, Parliamentary Secretary to the Minister of Health, gave some interesting figures on the progress now being made in housing. For the first time to our knowledge a member of the Government has been optimistic enough to state in public that not only are houses now being built in sufficient numbers to meet the normal requirements of the population, but that at last some headway is being made in reducing the actual shortage. In the year ended March 31 last, no fewer than 136,889 houses were completed, of which total 117,817 were working-class dwellings. From the information at his disposal, Sir Kingsley Wood was able to tell us that last year's total would this year not only be equalled but passed, provided that no stoppage occurs.

Private Enterprise in Housing. AFTER the experience with municipal and Government building during the past few years, it would appear from the figures given by Sir Kingsley Wood that private enterprise in house building is again becoming firmly estab-

lished. Out of the total number of houses built during last year no less than 116,261 were put up by builders, and only 20,628 by local authorities. We have always contended that the erection of houses should be left in the hands of those who have made a lifelong study of the business, and it is a significant confirmation of our views that private enterprise has been responsible for 82 per cent. of the total during the record house-building year.

Payment for Wet Time.

DEFINITE steps are now being taken to secure payment to building operatives for time lost when it is impossible to carry on during inclement weather, and all with the best interests of the industry at heart will wish the idea success. The proposal has been formulated by the operatives, and the cost is put at 1s. per week per head. This, we take it, is only a tentatively suggested figure, for it is highly probable that the cost would be very much less; that, however, is a point to be discussed with the advice of actuaries, and the question as to whether such a fund should be controlled by the operatives alone or by a joint committee representative of employers as well as workers is to be decided. It is a sound feature of the suggestion that only 50 per cent. of

the full rate should be paid for "time, for there are few who would stand about on half wages in inclement weather when they could earn a wage. This is an instance of the work which architects can do when they take an active interest in the mundane affairs of the industry which they are so vitally connected with. It is undoubtedly an outcome of the suggestion made by Mr. Maurice Webb, Mr. Fletcher, Mr. Alan Slater and a few other architects who investigated the problem a few months ago, and surprised not only themselves but many building employers as well when they showed how small a sum would be necessary to ensure that the operatives should have at least their normal income when prevented from working through no fault of their own.

Crosby Hall.

It is good news that Crosby Hall, removed from the City so long ago as 1885, and re-erected at Chelsea under the skilful direction of Messrs. Wright and Godfrey, is at last likely to be put to new uses for which it was intended. It will be recalled that when the Hall was threatened with destruction—its value as a site in Bishopsgate having been appreciated for commercial development—the University and City Association decided to rebuild it in Chelsea (by a happy

A View in the Basilica, Palace of Arts, British Empire Exhibition.

SIR JOHN W. SIMPSON, P.P.R.I.B.A., and MR. MAXWELL AYRTON, F.R.I.B.A., Architects.

on, on the garden of Sir Thomas More, e-time occupant of the Hall) with a view its being ultimately incorporated with home for women graduates of the mpire. This scheme, owing to the lack funds, has languished through the serving years, and though the Hall s been used for functions associated th the British Federation of University omen's movement, it has always looked her forlorn in its isolated position and her unkempt surroundings. At last e buildings with which it is to be linked as an organic element are, it is reported, out to be commenced in part, though it ll be some time before the whole scheme n be carried through to completion. e learn that there will be ultimately a idential wing at the north corner, placing No. 15, Danvers-street, and a ath tower and a main frontage in eyne-walk, the total accommodation the new buildings being sufficient for 0 graduates, with a large quadrangle. e Great Hall will be used normally as e common dining-room except when quired for more important occasions. is gratifying to know that this uncom- only interesting scheme is at last coming fruition. To preserve old buildings is laudable aim enough, but to put them a really useful purpose is better still, d the final justification of preservation.

Town Planning. VERY instructive and interesting is the paper just issued by the Ministry of ealth in the form of extracts from its annual report. That some real activity being shown by local authorities and hers in the development of town- nning is evident enough; the increase the number of local authorities engaged the preparation of schemes is one of the idences, especially as in so many cases ir action is not obligatory. Whatever y be the outcome of the coal mining ustry in Kent it is well to know that need not devastate "the fair land of nt" if the recommendations of the ent elaborate report are followed. (See East Kent Regional Planning Scheme iew, by Professor Abercrombie.) It is ively that real difficulties lie in the h of anticipatory plans for the pro- tion of areas against the encroachment industrial enterprise and the securing more and more open spaces, but if l authorities once fully realise their onsibilities and opportunities we may e for a reasonable measure of security the future of suburban and country s. If the East Kent coal and iron elopment assumes the proportions ed for and the population is more a doubled, it will readily be seen t a serious problem such development gs before us.

Bronze foundry. IN a letter from the chairman of a bronze foundry in this country ding for the special patronage of our industry against that of other atries, we may note the difficulty

which besets our sculptors in placing orders for bronze castings. Mr. Wm. Morris complains that Mr. John Tweed insists on placing bronze foundry on a strictly commercial basis, but if bronze founding in this country does not pay whilst it is trying to compete with foreign production, what is to be done? Mr. Tweed says if bronze foundries here do not reduce their prices he will give his work to Belgium, but we suppose he will not refuse to let them try what they can do in competition.

On the Choice of an Architect. YEARS and experience do not necessarily go with the production of the finest art, though they may count for much in the practical things of life. Ideality, imagination, and generosity of sentiment are mostly the gifts of our younger men, but we think the Leeds and Yorkshire Architectural Society have raised rather an awkward question when they plead for the essential right of Leeds architects to make the design of a new street in that city. There is a certain sweet reasonableness in the idea that Leeds should be able to look after itself in the matter of art, and that if the art of Leeds is not as good as the very best that could be obtained elsewhere, Leeds should anyhow be satisfied with it. We have great sympathy with local ambitions and would see them encouraged to the utmost, and we have also great sympathy for the young, but we fear Leeds has invited some rather awkward comparisons. After all, would not an open competition for the new street be a more satisfactory affair than an attempt to nail the matter entirely down to Leeds itself?

The "Voice" of the Public. WHEN the new temporary Waterloo Bridge was first opened it was generally noted that the bulk of pedestrians made a point of using it in preference to the old one. Now that the novelty of the new bridge has worn off the old one has returned to favour; whereas its pavements are again almost as crowded as they ever were, especially during the morning and evening rush hours, the one gangway of the steel bridge attracts a mere handful of pedestrians. Without wishing to attach any undue significance to this phenomenon (for it has to be remembered that the new bridge deviates twice from the straight line of crossing—and your Londoner is not given to unnecessary peripatetics) it is not unreasonable to deduce that the old bridge has an appeal that the new one does not, and consequently that any substitute bridge will not, possess. Can it be that in this instinctive selection we have, at last, some reliable evidence of the real views of the inarticulate public?

Sculpture in Concrete. THE figure illustrated on this page is the work of Mr. F. W. Doyle-Jones, A.R.B.S. A massive male figure supporting a masonry block, symbolising

A Figure in Cast Concrete.
By Mr. F. DOYLE-JONES, A.R.B.S.

Strength and Immutability, the statue has been made to demonstrate the possibilities of carved concrete or synthetic stone as a medium of expression for sculpture—particularly when the method of casting the preliminary shape is that of the latest sand mould procedure, a method similar to that used for bronze casting. The colour difficulty has been overcome by a "mix" of Portland cement and crushed Portland stone. This concrete, especially when "tooled" has all the appearance of Portland stone.

A Walpole Hanging Cabinet. THE Victoria and Albert Museum has recently acquired by purchase, out of funds of the Murray Bequest, a hanging cabinet of kingwood, designed by and for Horace Walpole in 1743. The doors are enriched with eighteen ivory plaques, mostly of Italian seventeenth-century work, and on the pediment are ivory figures of Palladio, Fiammingo and Inigo Jones, by Ver-skovis after Rysbrack. It is exhibited for the present, together with other important new acquisitions, on the ground floor of the Museum in the Central Court (Room No. 43).

GENERAL NEWS

Irish Beet Sugar Factory.

Messrs. Lippens have decided to erect their new £400,000 factory at Carlow, and are acquiring thirty acres of land for the site.

Asthall Manor.

Lord Redesdale has sold 2,000 acres of the Asthall estate. The mansion and about 120 acres remain for sale by private treaty. Asthall is an "E"-shaped Tudor manor house.

Peterborough Road Scheme.

Peterborough's £250,000 scheme for widening Narrow-street has been confirmed by Parliament. State help towards the scheme is being sought by the Peterborough City Council.

Central London Site Sold.

The Beecham Trust have completed negotiations for the purchase from Mr. S. B. Joel of the important London site which was formerly Meux's brewery, Tottenham Court-road, an area of 2½ acres.

Proposed Hudson Bridge.

Preliminary surveys are now being made for a 3,500 ft. bridge across the Hudson River from Manhattan to New Jersey to relieve the growing congestion of motor traffic in and out of New York.

Major Tibbets' Memorial.

The Benares Hindu University has accepted from Mrs. Walter Tibbets a museum of Eastern and Western Art and Travel, to be erected to the memory of her late husband. The museum will be designed by Sir Edwin Lutyens.

Proposed Whitechapel Road.

A new arterial road to be constructed between Whitechapel High-street and the new Beckton by-pass road has been suggested by Mr. B. J. Belsher, Borough Engineer and Surveyor of Stepney. The proposal is receiving the consideration of the officials of the Ministry of Transport.

Future of Platt Hall.

The Manchester Corporation Committee which is considering possible uses for the Georgian mansion known as Platt Hall, recently decided to ask the Council for another month's time. It has been suggested that the hall might be used for an exhibition place for such things as architectural models; as an adult education centre, a welfare centre, a nurses' home, a convalescent home, a branch of the tuberculosis office, an art gallery, or a place of amusement.

Housing Figures.

A chart has just been prepared by the Garden Cities and Town-planning Association, showing the total result of the housing energy of this country in the last five and a half years. The yearly totals of all classes of house building are of special interest.

	Houses.
1920	15,811
1921	86,669
1922	102,298
1923	80,816
1924	121,679
1925 (six months)	60,982
Total	468,255

Central London Estate Sold.

Lord Howard de Walden has sold a large block of his estate to the Audley Trust, Ltd., of Moorgate, London, E.C. The portion of the estate sold comprises about forty acres extending northwards from Oxford-street to Euston-road and eastwards from Oxford Circus and Regent-street to Wells-street. The price is said to be about three million pounds.

The Cambrian Archaeological Association.

The Cambrian Archaeological Association recently held its annual meeting at Llandilo. In the general committee's report reference was made to the excavations at the Gaer, Brecon, and on Offa's Dyke, and the Ysceiog Circle, Flintshire, the dyke having been surveyed and

the original contours of its ditch determined in three places. The excavation committee reported that Mrs. Gough, the owner, had granted permission for the excavation of the Roman fort at Caerhun, and that Dr. Wheeler had promised to undertake the work after the completion of the Gaer.

Newcastle Gaol.

Newcastle Gaol having been closed by Home Office order, the building and site have been acquired by the Newcastle Corporation, and demolition work is being carried out. One-third of the site is to be occupied by a new telephone exchange, and the remainder will be utilised for business premises.

Proposed Glasgow Cinema.

The Dean of Guild Court has recently passed plans for the erection of what will be Britain's largest cinema, to accommodate 4,000 persons, which will be situated at the corner of Renfield and Renfrew streets. The plans also provide for a dance hall, and have been drawn up by Mr. John Fairweather, F.R.I.B.A.

New Hartlepool Lighthouse.

At a recent meeting of the Hartlepool Port and Harbour Commissioners it was decided to invite tenders for the erection of a new lighthouse in place of the existing temporary building, on the site at Hartlepool Heugh approved by Trinity House.

East Sheen Lodge.

East Sheen Lodge, Richmond, formerly the residence of the Duke and Duchess of Fife, and in the eighteenth century the home of the first Lord Palmerston, is being converted into flats.

Manchester Town Planning.

The Town-planning Committee is proposing a number of new road works estimated to cost £300,000, and to provide employment for 1,270 men for an average period of six months.

CORRESPONDENCE

[While we are glad to publish letters on professional and other matters of interest to our readers, it must be understood that we do not necessarily endorse the remarks of correspondents, who will oblige us if they will express their views as briefly as possible.]

Proposed New Shirehouse Extension, Norwich.

SIR,—I was an unsuccessful competitor in this competition, and therefore not "an outside observer" (as is Mr. Sositts, whose letter you published last week) and beg to be permitted to pay a tribute to the simple solution to a very difficult problem achieved by Mr. A. Dunbar Smith (to whom I am personally unknown). I think that the existing building has little or no architectural merit; but, in any case, I cannot conceive that any one would attempt to introduce its general feeling into any building planned primarily for offices. It must be a matter of opinion as to whether the successful competitor has "made too great a contrast between the old and new"—mathematics or any exact science will never determine such questions; and, following Mr. Sositts, one cannot give reasons, but only opinions, or "general feelings."

My main point in writing, however, is to protest against the growing tendency to criticise competition awards. If the competition principle is wrong, either as a whole or in part, let us scrap the thing and introduce a new system. I am not going to argue for or against the system as we know it, but I would insist that the time to criticise a competition is when the conditions are issued. In any case let us abide by the umpire's decision. Next to winning a competition it is always the greatest pleasure to be beaten by a better man. Whatever can be said against the competition system as we know it, the best designs, in my opinion, are invariably placed first.

Bristol.

J. H. H.

COMPETITION NEWS

Dundee Secondary School.

In response to an invitation by Dundee Education Authority, thirty designs for a proposed new academy in the West End of the city have been submitted to Mr. J. A. Carfrae, assessor, Edinburgh, who has made the following award:—1, Messrs. Thoms & Wilkie, architects, Dundee, probable cost £104,554; 2, Messrs. Maclaren, Soutar, & Salmond, architects, Dundee, probable cost £88,700; 3, Messrs. Gall & Hay, architects, Aberdeen, probable cost £82,334 19s. [The winning design is illustrated on pages 392-395 of this issue.]

Manchester Town Hall, Extension.

The scheme for the extension of Manchester Town Hall by the erection of a new Reference Library and other buildings, on the large plot of land bounded by Lloyd Street, St. Peter's-square, Peter-street, and Mount-street, has been approved by the Manchester City Council. It is recommended that the report and scheme of the city architect be generally adopted and that competitive designs be obtained for the erection of the necessary buildings, which will be put up "as opportunity arises and occasion requires."

Coventry and Warwickshire Hospital.

Proposed New Ward Block.

The promoters of this competition having decided to revise the conditions in accordance with the R.I.B.A. Regulations, the President has appointed Mr. C. E. Bateman, F.R.I.B.A. as Assessor.

Competitions Open.

	Particulars published in "Builder."	Sending in date.
Drammen Bridge (Drammen-selven). Premiums: 10,000 Norwegian crms., 8,000, 6,000. Apply Gov. Eng., Drammen..	May 29 ..	Oct. 1
Newcastle Fire and Police Station. Premiums: £500, £300, £100. Mr. P. S. Worthington, F.R.I.B.A., Assessor..	June 12 ..	Oct. 8
Town Hall, &c., Pretoria. Open to architects residing in South Africa or Registered under Architects' Act, of 1909, Transvaal. Assessor to be appointed by R.I.B.A. Premiums: £250, £150, £100..	— ..	Nov. 30
Argentine Institute. Premiums 10,000, 6,000, 4,000, 3,000, 2,000 gold pesos. Apply parties, 35, Old Queen-street, S.W.1	April 24 ..	Dec. 3
New Buildings for Liverpool College, Mossley Hill. Sir Giles Gilbert Scott, R.A., Assessor. Premiums: £500, £300, and £200. Apply to J. H. Lintern, Secretary, Liverpool College, Sefton Park-road, Liverpool	Aug 7 ..	1926. Jan.
Australian War Memorial, Canberra. Open to architects of Australian birth. Apply High Commissioner, Australia House, Strand, London	Aug. 14 ..	Mar. 1
Plan for construction of Conference Hall, for League of Nations, Geneva. International Competition. Sir John Burnet being British representative on Jury of Assessors. 100,000 Swiss francs to be divided among architects submitting best plans. Programmes will be deposited in due course with R.I.B.A., 9, Conduit-street, where intending competitors should apply. Single copies from Secretary-General, League of Nations, Geneva, on payment of 20 Swiss francs.	Jan. 2 ..	—

* Competitions when "warned" or vetoed by R.I.B.A. are starred.

The Monument Urn.

The Urn at the top of the Monument is being regilded. The Urn, which was last gilded in 1914, is made of copper and is 46 ft. de The contractors estimate that they will 700 books of British double-beaten gold.

Arley Colliery Housing Scheme, Gun Hill, Arley.

MESSRS. DOUGLAS G. TANNER & ARTHUR L. HORSBURGH, Architects. (See p. 386.)

OLD DOMESTIC ARCHITECTURE OF ST. ALBANS

By H. V. MOLESWORTH ROBERTS

Part I.—Mediæval and Early Renaissance.

REPEATED visits to St. Albans, Hertfordshire, have endeared this romantic town to the writer and revealed more and more of its hidden and little-known treasures; but they have also shown how insidiously yet rapidly some ancient landmarks are being effaced or mutilated, and have implanted the conviction that such relics of a more beautiful past must, as far as possible, be described and recorded, ere they are lost for ever. A brief but, it is hoped, stimulating sketch of the smaller domestic architecture of St. Albans is here given.

St. Albans, like many other ancient cities, retains in its streets and by-ways many charming houses and cottages, ranging from perhaps the late fourteenth and fifteenth centuries to the eighteenth century and later, the earlier ones half-timbered and sometimes targetted, with overhanging upper stories, and the later ones weatherboarded or of brick. The oldest of all are to be found in those streets in the heart of the town which together form the site of the mediæval city.

One of the earliest, as far as we are able to determine, is that used as a furniture warehouse by Messrs. Mayle, on the north side of George-street, near the angle of the modern Verulam-road (14 on plan), though an unsightly brick edifice has been built on the actual corner.

This building, probably dating from the fifteenth century, is of two stories; on the south (George-street) front, the lower story has been converted into a shop front, but the projecting upper stage, slightly inclining forward with age, is of vertical timbering with restored filling, retaining several ancient oak mullioned lights with foliated heads; larger windows seem to have been inserted in the seventeenth century. The side of the rear part of the building, overlooking a yard to Verulam-road, is stuccoed, but has a long, many-light mullioned window of early date. The George Inn, adjoining Messrs. Mayle's on the west of its George-street front (13 on plan), claims an early fifteenth-century date, but has long since been refronted in brick.

Another and more celebrated building is the Moot House, on the west side of the Market-place (17 on plan), now used by local publishers and printers (Messrs. Gibbs & Bamforth). It probably belongs to the fifteenth century, though now much mutilated and difficult therefore to adjudge. Its projecting upper story has been stuccoed over for years, and regrettably enough has been recently pebble-cast, with

apparently false timbering; a fine opportunity has here been lost, one feels, for exposing the old timbering, which is probably *in situ*, and merely repairing the infilling where necessary.

The old houses in French-row, farther south than the Moot House, make up a very romantic group looking from the market place (15 on plan), and include the historic Fleur-de-Lys Inn. These are likewise probably of the fifteenth century, though the overhanging gables, somewhat out of the perpendicular, have been plastered over. Opposite, and looking on to the market place, is a higher building of the same character, bearing a seventeenth-century date, but probably earlier, now occupied by Messrs. Boots (16 on plan). A Tudor fireplace has recently been discovered and rebuilt in an upper room.

Two larger monuments further from the mediæval city, but outside the scope of this article, should be mentioned here in chronological order—the red-brick ruins of the so-called Sopwell Nunnery, south-east of the city, really a Tudor house on the site of a nunnery; and the larger ruin at Gorhambury, several miles to the west, an Elizabethan mansion built for Lord Bacon, but now half destroyed.

Afterwards the City of St. Albans came to be extended, when what is known as the Early Renaissance period developed its own manners of design. The High-street and George-street were continued westward by a long winding road (Fishpool-street), which dipped southward and then north-westward to skirt the strip of

HALF-TIMBERED BUILDING, GEORGE-STREET.

MOOT HOUSE, MARKET-PLACE: VIEW FROM DAGNALL-STREET.

EARLY BUILDINGS IN FRENCH-ROW,
LOOKING SOUTH.

land between the Anglo-Saxon mound called Kingsbury Castle on its right, and on its left the old fish-pool of those early times; the delightful river Ver, almost the sole survivor of the pool, still washes the foot of the gardens behind the unpretentious houses in the street to which we have referred. Building operations were apparently carried along this Fishpool-street about the late sixteenth and seventeenth centuries, from which period much work of the character of this time survives.

The earlier buildings in this street appear to be those at its north-western end, near the bridge by which it is continued into the picturesque village of St. Michael's; several cottages at this spot, containing early leaded windows, appear to come down from the sixteenth or early seventeenth century (6 on plan). There are some half-timbered houses (3 on plan), with brick filling possibly later in date, in St. Michael's-street, across the bridge, including the "Three Bells" public house. In Fishpool-street, again, are the buildings of St. Michael's Manor; the westernmost or Garden House (7 on plan) is of Stuart type, with its one-mullion one-transom ground-floor windows, and its pargeted panelled treatment; the house proper, farther east, is more distinctively Georgian, at any rate in its fenestration (9 on plan). Proceeding along the same curious and tortuous thoroughfare, terraced on the north side at a higher level because of the Saxon elevated ground behind it, one finds many and various houses of different dates; a tall building in the re-entering angle (10 on

HOUSES AT FOOT OF FISHPOOL-STREET, LOOKING SOUTH.

plan) is especially interesting as having once formed part of an inn, and has the same traditional treatment of pargeted bands carried round the windows and along the framing—a characteristic relic. The top story is a projecting one, well emphasising the angle of the street, and the same may be said of many two-storied cottages, stuccoed and re-windowed, but undoubtedly early in origin, intermixed with vertical fronted work of the "Anne" type, with wooden casements.

The more imposing but less picturesque work of the late seventeenth and eighteenth centuries, built in the so-called "Queen Anne" and "Georgian" styles, will be considered in Part II.

(St. Michael's Church was fully described in *The Builder* of March 4, 1921. Remains of the fourteenth-century domestic buildings of the Benedictine Abbey, recently excavated, were illustrated and described in the issue of June 6, 1924).

BOOK REVIEW

Principles of Architectural Composition. By ARTHUR STRATTON, F.S.A., F.R.I.B.A. (London: Messrs. B. T. Batsford, Ltd., High Holborn.) Folio. 25s. net.

Of recent years many books have been compiled dealing with the history of different phases of historic building. While these books have the merit of describing the pictorial qualities of the buildings, the text, more often than not, fails to give that analytical criticism which is essential. This book, which is primarily intended for students, is to be regarded as a key to certain forms followed by architects in Classic and Renaissance times. The author does not attempt to explain the theory of architectural design, neither does he enter upon the discussion of rules which are binding. On the contrary it is evident that he has researched among rare examples of Classic architecture and has had recourse to prints and drawings which are not generally known. The bias of the book is towards the best examples of the late Renaissance architecture, but models which became general in the eighteenth and nineteenth centuries are included. The various chapters of the book deal with the plans, elevations and sections. The work begins with examples of squares, circles and octagons, and from thence leads on to combinations of these figures. There are numerous drawings and diagrams of staircases, halls, vestibules and corridors. In another place, the dome, the spherical vault, and variations of these features, are dealt with. There are a few elevations which demonstrate the principle of rhythm and simplicity, some interesting screens, and other examples.

Nearly one hundred years have passed since a book of this nature was issued for the benefit of architectural students, the classic example being Durand. Perusing the book, one finds little to disagree with. There is no effort, either

obtuse or obscure, on the author's part to force the study of period architecture. He deals with the simpler types of building. The author approaches his subject as a teacher with a wide knowledge of the needs of his students, and he has demonstrated in each chapter a need for sequence in three dimensions.

The book has the distinction of being clear in its statements and sound in its historic references. Most people will be familiar with some of the buildings illustrated, but they should be delighted with the small scale diagrams which show the true value of simplicity. The author has produced a work which architects will regard as giving tangibility to ideas which have long been nebulous. Most people acquainted with historical buildings have retained some general idea of plans and geometrical form. The system advocated by the author was worked upon by the architects of the Renaissance, and later, who sought form from amidst the ruins or antiquity; and who, by ingeniously combining certain time-honoured classical ideas, produced buildings which they claimed to be original. Such methods are not exactly applicable to-day, but without a guide there is a danger of architects' designs becoming reminiscent of precedent and lacking in value of composition. That this fault is prevalent in the work of students becomes obvious when the elementary works of the schools are reviewed. Architects also are often prone to be careless in matters of geometrical arrangement. The author's book, excellent as it is, does not provide a remedy for illiteracy in architectural composition; it has been composed with a view to demonstrating the principles which underlie designs which are Classic in inspiration.

The author wisely keeps to forms which are in the main symmetrical. He has endeavoured to show that buildings must have a geometrical basis, and, within the limits he has imposed upon himself, he has reduced the motives to a reasonable summary.

Working Drawings of a City Bank and Office Building.

The working drawings, by Mr. H. Thearle, which we illustrate in this issue, have been awarded the Holland & Hannen and Cubitts Prize, Liverpool University School of Architecture. A subject such as a "City Bank and Office Building" is set first as an "esquisse and projet," and then afterwards as a problem in construction, for all students during the fourth year of their course. Those specialising in design make it their final "working drawings" scheme, but students taking Constructional Honours proceed from this to the more advanced problems of architectural construction. The programme asked for a combined bank and office building, the basement, first floor and mezzanine to comprise the bank accommodation, while the remaining floors were to be utilised for office purposes. The restricted size and rectangular simplicity of the subject enables the student to go very thoroughly into all the minor difficulties which would arise in actual practice. During the preparation of the drawings, lectures in steelwork design and construction are given, and very careful calculations of the steel frame to the building are demanded, the rough workings, from the concrete under the grillage to the rivets in the sections, having to be presented along with the completed drawings. It is necessary that the drawings should be in accordance with the local by-laws.

The Arley Colliery Company's Housing Scheme.

We published in our issue of December 1, 1922, a plan showing the proposed layout of this scheme, and at the same time the contractor began the erection of the houses. After 2½ years' work, the main roads are made complete with drainage, water supply, and sewage disposal work, and nearly 300 houses are occupied with a population of 1,700 inhabitants. Shops have been built to provide for the needs of these people, and it is now proposed to extend the scheme by a further 250 houses, complete with playing fields and recreation ground. In order to complete the village, it is proposed to erect a hotel, designed on the most up-to-date principles. The building will contain a large club room and public bar, both of which will be supervised by the landlord from one point, and will be capable of accommodating about 600 people at one time. In addition to this, ample provision will be made for supplying food in a comfortable coffee room. Adjoining this building are to be spacious gardens with a bowling green, skittle lawn and tea gardens. It is also proposed to erect a mission church, which can be used for meetings and social events. A site has also been reserved for a cinema. In the centre of the village is a good recreation ground surrounding a bandstand. The majority of the houses contain a living room, parlour and three bed-

rooms with a scullery and bathroom. The external walls are constructed with Haunchwood common red facing bricks, with the plinth and chimneys in brindle bricks; the internal walls with Messrs. Morris & Shaw's common bricks, and roofed with Rosemary tiles of varying shades. The architects are Messrs. Douglas G. Tanner and Arthur L. Horsburgh, of Birmingham, and the contractor Mr. F. G. Bursill, of Leamington Spa.

Warehouse and Offices, Lancaster.

This building is a steel-framed structure, and had to be strongly constructed for use as a linoleum depot. It is built of brick generally with a stone front to Cable-street in local dressed stone. The long front to Water-street is in buff bricks supplied by the London Brick Co. The floors are of steel and concrete with boarded or wood block finish. The roofs are flat, covered with asphalt. The general contractors were Messrs. Rainey Bros., Barrow-in-Furness, and the following were sub-contractors: Steelwork, Messrs. Banister Walton & Co., Manchester; asphalters, Messrs. T. Faldo & Co., Ltd., London; steel windows, Messrs. H. Hope & Sons, Ltd., Birmingham; lifts, Messrs. Wm. Wadsworth, Bolton; wood block floors, Messrs. Hollis Bros., Hull; heating, Messrs. Saunders & Taylor, Manchester; electric lighting, Mr. Inman, Lancaster. Mr. Charles B. Pearson, F.R.I.B.A., of Lancaster, was the architect.

Irlam Conservative Club.

This club provides the following accommodation:—Basement: Beer cellar, heating chamber, engine room for electric light plant, storage. Ground floor: Entrance hall and lounge bar, smoke room, card room, billiard room (4 tables), lavatories. First floor: Public hall to seat 450, supper room, servery, ladies' and gentlemen's lavatories, crush hall. Second floor: Steward's quarters. The general

contractors were Messrs. The Hall Construction Co., Ltd., Salford, and the sub-contractors were as follows: Plumbing and glazing, Mr. James Fletcher, Weaste, Manchester; plastering, Mr. J. Grundy, Irlam; slating and tiling, Messrs. Porter & Brew, Irlam; painting, Messrs. Jones & Jackson, Ltd., Manchester; wood block & maple flooring, Messrs. Hollis Bros. & Co., Ltd., Hull; terrazzo, Messrs. Diespeker Ltd., London; terra-cotta, Messrs. Hathern Station Brick and Terra-Cotta Co., Ltd., Loughborough; heating and ventilating, Messrs. E. Hatton & Co., Ltd., Manchester; 2½-in. facing bricks, Mr. Samuel Appleton, Northwich; steps, Messrs. The Christie Patent Stone Co., Stretford; steelwork, Messrs. Heenan & Froude, Ltd., Manchester. The architect is Mr. J. E. Kewell, L.R.I.B.A., of Manchester and Irlam.

Dundee Secondary School.

Some notes on the design placed first in this competition are given on page 395.

MEETING

MONDAY, September 14.

Institution of Public Lighting Engineers.—Second annual meeting and conference. At Leeds, Monday, September 14 to Wednesday, September 16.

Crosby Hall.

The erection of the residential wing at the north corner of Crosby Hall, Chelsea, will be begun within the next month or two, and when completed this old City Hall, built in 1499, will become the centre of hall of residence in London for 200 university women doing post-graduate work. Messrs. Wratten & Godfrey are the architects.

DUNDEE SECONDARY SCHOOL COMPETITION.

The awards in the architectural competition in connection with the proposed new secondary school at Ashcliff, Perth-road, Dundee, are given in the Competition News on p. 382. We illustrate this week the first premiated design by Messrs. Thoms & Wilkie, of Dundee. The competition was limited to architects practising in Scotland on their own account.

The assessor, Mr. J. A. Carfrae, reports of the first prize design that it shows the required accommodation suitably arranged in a building of two stories facing Perth-road, and of three stories at the rear, connected at the sides with corridors, while a hall, dining-room, etc., which form a centre block, are convenient of access from the whole school. The areas of ground apportioned to playgrounds are of good shape. The author states (says the assessor) that cross-ventilation has been provided throughout, but he (the assessor) points out that on the two lower floors this would be obtained through the corridors. It might be considered desirable to provide a lower ceiling in these, so that openings opposite classroom windows might be independent of corridor windows and have more direct outlet, like those on top floors. The south aspect of the building might be made a little more interesting without great expense.

The assessor, in a letter to the authority on the subject of costs, states that the first design has been estimated at a uniform rate, and that is high one. There is a greater number of cubic feet in this design (than in the others) but in architectural features it is of a simpler character than the second. The specification provides for a more complete system of fire-proof flooring, which, in his opinion, could be modified. He is therefore of opinion that the cost of this design (£104,554) has been over-estimated.

A PLEA FOR THE LAYMAN

By WILLIAM W. WOOD, A.R.I.B.A.

"BEAUTY," says my dictionary, is "a particular grace or excellence," and it is just this quality in architecture that is so difficult to define. All buildings cannot be beautiful to all people, but many buildings are beautiful to most people. There is a fallacy amongst architects that the layman is not interested in architecture. Actually he is interested, but in the company of architects he is afraid to express an opinion; he has heard so much about styles and influences that he is fearful lest he should praise a building of the type not then in vogue. And surely it is that important person "the man-in-the-street" who is the best judge of what is beautiful in architecture and not the practitioner himself, brought up in some particular school of thought, often a confirmed Classicist or Gothickist before he has reached maturity? Might not beauty be defined as that combination of good qualities which makes the greatest appeal to the greatest number?

A setting sun in a sullen sky and a group of factory chimneys in silhouette—the passer-by is arrested by the sight and perhaps wonders why. The explanation lies in the combined effect of colour, composition and contrast. A winding narrow street, projecting gables, casement windows, shabby lines, and we have picturesqueness. The Parthenon on its hill, perfection of form—idealism. A Gothic cathedral, pointed arches, slender columns, misty heights, ugly details—etherealism, decoration, individuality, glamour. Two marble pavilions linked by a colonnade, approached by many steps—realism, symmetry, proportion, dignity. The Colosseum—magnitude. But in addition to all this there

is nationality, tradition and personal association, and to the layman no building is so beautiful as the one possessing these three qualities. The last is outside the influence of the architect, but the others are not, although too often disregarded, or there would not be so many unsuccessful buildings in our midst.

The Renaissance naturally originated and flowered to perfection in Italy, the renaissance of a national form of expression, and was unnaturally introduced into France and England—a hot-house plant in a northern clime—where society made it the fashion. If some individual decided to erect a pyramid on his country estate people would go to see it, call him eccentric, probably mad, and the thing a curiosity. But in its natural setting, a survival of a past civilisation, an upcropping in a flat landscape, the pyramid is felt to be logical, the tomb of a great man.

If we look into the history of the birth of Gothic architecture in this country we shall find eclecticism, foreign forms adapted to the clime, and the needs of the times. Churches built to the glory of God, but not forgetting the frailties of man. So, too, the Romans borrowed from the Greeks. Eclecticism is a fine thing—let us go out and learn from the Chinese, the Indians, the ancient Egyptians, the Greeks, the Romans and Americans, but let us come home and present posterity with a thing of beauty, possessing the qualities of nationality and tradition, expressed in the terms and the materials of our era.

Tradition has been wonderfully preserved in

the domestic architecture of Norfolk and a few other counties where, founded on local conditions, materials, and usages, it is still very much alive.

I do not want to be accused of taking refuge behind my present title in order to advocate Gothicism. My desire is rather to discover the real essence of beauty, and sometimes if we cast off our professional mantle and look at it from a distance we see more clearly the cut of the cloth. I am, of course, only discussing the exterior of buildings, for it is a first principle that a building must be planned in a manner best fitted to its particular needs, and it is pedantic to say that the elevation must express the plan.

Our domestic architecture is probably the most beautiful in the world—even the Americans tell us we can beat them in this direction—it is chiefly in our public buildings that we fail. Some recent exceptions, however, point the way, and amongst these Liverpool Cathedral, the Middlesex Guildhall, and Heal's shop in Tottenham Court-road stand out as striking examples of three quite dissimilar types. Liverpool Cathedral is first and foremost an English cathedral, although Sir Gilbert Scott is credited with saying that he was influenced a good deal by Spanish work. The Middlesex Guildhall speaks of Gothic and Classic influences, and so successfully occupies its site between the Abbey and the pseudo-Classic block of Government buildings, but it is also essentially modern. Heal's is simply a twentieth century furniture shop and therefore, fulfilling all the other canons of good design, is beautiful.

The average man says, in effect, "What have I to do with thee, O thou of little faith?" Let architects have faith in their own country, in their own buildings, and in their own times, and this apparent apathy will disappear, for "a thing of beauty is a joy for ever."

Plans of Irlam Conservative Club.

ARCHITECTS' & BUILDERS' INQUIRY BUREAU

We are glad to give questions and answers, but cannot accept responsibility for contributed replies, especially on legal matters.

May we appeal to our correspondents to submit their queries on paper of a size easily filed, and written as legibly as possible, or, better still, in typewriting!—ED.

Hot Water System.

[REPLY TO "SEEKER," JULY 31.]

SIR,—The size of storage tank required for the system proposed by your correspondent depends very much upon the times when it is intended to pump and the type of propulsion. If the latter is economical and attendance is regular a two days' supply of water might be sufficient, but in the event of a breakdown in the plant serious inconvenience might be felt and a week's supply or more is desirable. If there are baths in the house, a daily consumption of 30 gallons per head should form the basis of calculation. The domestic hot water supply system should have its own independent cold supply tank, so that the unusual demands upon the cold supply would not exhaust the hot water system. It is quite sufficient if the water level in the domestic hot water supply tank is kept only just below the level of the bottom of the storage tank. If the well is properly proofed and judiciously sunk, its proximity to the house or pump is of quite immaterial concern, but it is advisable to sink it at least 50ft. away from any drains, soil or surface water. FINDER.

Architect's Fee for Abandoned Work.

SIR,—I should be glad if you would, through the medium of your Bureau, give me a ruling as far as is known on the following point.

A client desirous of building a house interviewed an architect bringing his own design, which, after certain re-modelling and obtaining of tenders, was found to cost too much, so this was quashed and the architect remunerated for the abandoned scheme. A fee had been agreed upon for the whole supervision, &c., had that particular design been carried out, the client asking the architect "What would he do it for?" and the architect taking that as meaning, "would he do it at a lesser figure than the usual scale?" rightly or wrongly named a fee below the usual scale (he is not a member of the R.I.B.A.). It was then decided that the architect should prepare a design for a different house, and finally this was adopted and the architect said he would accept the originally agreed fee.

The point is, when should the client settle the architect's account—when he has taken possession of his house, or at the end of the three months allowed to elapse after that, and before the builder does certain repairs and making good? It is assumed that completion of the house was when the client took possession in this case, roughly eight months from the start.

The architect had no payments on account of his fee and holds a letter from his client to the effect that the fee agreed upon would be, of course, paid on completion.

B. WARE.

Dry Rot.

[REPLY TO "ANXIOUS," AUGUST 28.]

SIR,—Your correspondent must recognise dry rot as an infectious disease that will readily develop into an epidemic unless the most rigorous measures are taken. It is not sufficient to create a healthy condition that would be a preventive in the first instance. It is not even sufficient to cut away all affected timber, as the fungus may still be germinating in the adjacent soil or on the surface of adjacent brickwork. The affected parts (and be sure to go well beyond them and well into the healthy timber) should be cut out and together with the adjacent soil, be burnt. The walls and the adjacent ends of sound timber should then be thoroughly washed over with corrosive sublimate in strong solution. Then, and then only, is the time to consider creating the healthy

conditions that should ensure that the disease will not recur, and the well ventilated floor space is very necessary for this purpose. Your correspondent will find the pamphlet issued by the R.I.B.A. full of very valuable information upon the subject.

FUNGUS.

Obstruction of Light to Window.

SIR,—The two new houses shown on the accompanying sketch are being erected on a piece of land which divides two existing terraces of houses. The front face of the new houses projects about 4ft. beyond the face of the terrace of houses on the south-westerly side of the site. A little side window (about 18 in. width of opening), has been placed in the gable end of the left-hand new house. This new window overlooks the front entrance garden and entrance doorway of the end cottage, marked "B" on sketch. The tenant of the cottage "B" has erected a hoarding projecting about 4 ft. from his wall face on to the garden wall, which separates the cottage "B" from the new houses. This new hoarding defeats the purpose of the new end window, and, therefore, annoys the owners of the new houses. Has the tenant of cottage "B" the right to erect the hoarding; and, if so, are there any methods of compromise by which he can be made to take it away? "MONTAGUE."

The owner of the left-hand new house "A" was entitled to place the small side window in the position shown; but, although he has the natural right to receive vertically the light appertaining to the situation of his tenement, he has not the natural right to the light laterally. If, in respect to any tenement, light received laterally has been actually and continuously enjoyed for twenty years by the owner or lessee of the property, he acquires an easement to the light so received. That easement consists in the right to require the servient owner (in this case "B"), to abstain from obstructing the passage of light communicated from the direction of the servient tenement to the dominant tenement. "A" has obviously not acquired an easement; therefore, it is clear that "B" is within his rights and is entitled to erect the hoarding referred to; provided the obstruction is on his own ground, and there is no restrictive covenant in the title deeds of the land restraining him from making such an erection, and he does no more than will enable him effectually to prevent excessive enjoyment. Indeed, it is the one method usually employed to preserve one's rights in such cases, and "A" has no method of "compromise" by which "B" can be made to take it away. "B" can dictate terms, and, perhaps, in the circumstances, he will be somewhat tardy in making them—if at all. B. D. K.

Tiles Splashed with Cement.

[REPLY TO "CEMENT," SEPTEMBER 4.]

SIR,—Rub off the stains of cement and mortar with fine carborundum stone, and if they still show, colour the tiles with red ochre mixed with copperas melted in boiling water and allowed to cool, and apply two coats. I presume the tiles are red. G. W. H.

British Thermal Unit.

(REPLY TO "CHERCHER," AUG. 14.)

SIR,—Replying to "Chercher," as per your issue of August 14, the British Thermal Unit (B.T.U.) is the accepted standard unit of measurement, in English-speaking countries, the quantity of heat action, and is "the amount of heat required to raise 1 lb. of water 1° Fahr. (from 39 deg. to 40 deg. F.), i.e., at the point of greatest density." For all practical purposes it may, however, be defined as "the amount of heat required to raise 1 lb. of water per degree Fahr." W. G. W.

Boundary Wall Question.

[REPLIES TO "J," AUGUST 28.]

SIR,—It appears from the query, that the question of liability for payment does not arise, but that "B" is bound to pay "A" half the cost of the wall. In making up his claim "A" should therefore include in his account the actual expense of the work done, and at the time it was done, allowing for old materials, &c. He need not consider the pre-war rates at all. If the work is in the Metropolis, see section 96 of the London Building Act, 1894. A. J.

SIR,—The share in cost of the wall payable by "B" is half the actual cost of the wall, "A," that is, providing use is being made of the former of half the entire wall, or, in other words, that the entire wall abuts upon "B" property. If the share in cost were assessed upon to-day's prices, "A" would obviously be making a profit on the transaction, and all probability would find the half value to be the first cost of the whole wall. This will react upon the agreement. A certain reverse case may be quoted to make the matter still more clear. I can vouch for the facts. The owners of city property (X) underpinned an old party wall to form a basement. In doing so they went down something like 30 ft. to gravel, indeed they did with all walls of the building. Their neighbours "Y" building a year or two afterwards, built a raft instead of going down to gravel, thereby, it was calculated, saving half the cost of the foundations, and they claimed that they could equally have had the cost of the foundations of the party wall. The Party Wall Award, however, ruled that "Y" must pay for half the actual cost of underpinning as executed by "X" in spite of any protest as to extravagance of means. LEX.

Preserving Post Ends.

[REPLY TO MR. T. BURTON, AUGUST 21.]

SIR,—While recently at Birmingham Race Course, I noticed a quantity of close board fencing erected entirely on concrete posts which were slotted for the horizontal rails, which were in wood, and the whole bolted together. As a fence I should consider to be practically everlasting, and I have yet to know of a method whereby a wood post can be rendered secure from rot. Even where the feet are buried in concrete, a slight shrinkage in timber opens a small gap through which water can soak in and ultimately set up rot. FIFTE

Cold Water Supply.

[REPLY TO "QUERY," SEPTEMBER 4.]

SIR,—It would be inadvisable not to insulate the cold water pipe. What will keep the heat will keep out the cold (frost). Wrap the cold service pipe in felt with canvas backing and coat the heating pipes with asbestos in position, which will conserve the heat for radiators, &c., and stop the cold water from turning into warm. G. W.

Partnership.

SIR,—Can one of your readers inform me the probable sum required to enter a practical partner in a country market town? ZEN.

THE BUILDING TRADE.

SETTING OUT A STAIRCASE.—II.

(Continued from page 3 5, September 4.)

Definition of Parts of Staircases.

Stairs consist in their simplest form of two parallel bearing timbers known as *strings* placed at an angle from the point of departure to the point of arrival, the space between them being filled in with boards forming rectangles having the upper surface horizontal and the upright surface vertical.

DETAILS OF FLIGHT

The horizontal surface being the portion stepped on is termed the *Tread*; and the vertical face is known as the *Riser*.

Of the side supports or *strings*, that against the wall is known as the *Inner or Wall String*, and that further from the wall is termed the *Outer String*.

Outer strings are sometimes notched out on their upper surface to conform with the tread and riser of each step, their lower edge being

CUT STRING

CUT-MITRED STRING

CUT-MITRED-MOULDED

parallel to the slope of the stair, as in ordinary solid strings. Such notched strings are known as *Cut Strings*; and in all but the cheapest work

the vertical portion of the notch is cut splayed and the riser mitred therewith. The string is then termed a *cut-and-mitred string*. Cut strings are generally of greater thickness than ordinary solid strings, being $2\frac{1}{2}$ in. and they have the effect of saving the *carriages* described later. Cut strings in newel stairs are mortised and tenoned into the newel posts at the top and bottom.

Housed Strings.—Solid or closed strings have both upper and lower strings running parallel to the slope of the stairs, and housings or grooves are cut in their inner faces to receive the ends of the treads and risers. The method of cutting the housings or grooves is as follows. After the steps have been marked on the face of the string as has been already described, the next operation is the marking of the underside of the grooves for the treads and the inner sides of the grooves for the risers to a shape suitable to take the thickness of the treads and risers, together with the wedges which are driven in and glued for stiffening.

As has been indicated, two thin templates are prepared, a riser template and a tread template, and applied to the lines of the steps already drawn on the inner faces of the strings. A brad-awl hole is made in the centre of the nosing of one of the treads so that the template may be held in position by means of a brad-awl passing through the hole. The riser template

HOUSED STRING

is pushed up against the tread template, having its outer edge coinciding with the line already drawn for the outer face of the riser. The underside and inner side are then marked round and the shape of the grooves obtained on the strings. The grooves are then cut by means of a brace and bit having its centre placed in the brad-awl hole when a rounded sinking is cut, the outer half of which becomes the grooving for the nosing of the tread. Then one or two further circular borings are made with the same bit for both tread and riser, being so placed that their circumference is tangential to the outer faces of both tread and

riser. The intervening portions of wood left are then chiselled out, by means of which a portion of the tread and riser groove is obtained at the nosing end of the tread and its junction with the riser. This preliminary boring, besides giving the rounded sinking for the nosing, permits the use of tenon-saw for the cutting of the rest of the lines marked.

The tenon-saw used is that known as a *stair builders' saw*, which is of the type here shown

and has a raised point on the back for the left hand to rest upon. The wedge-shaped grooves having been cut top and bottom, the intermediate wood is removed by a chisel, and the grooves are then smoothed by the use of a router plane.

The finished string with a tread and riser in position then bears an appearance as shown

here, the wedges being shown driven in and glued.

Wreathed Strings are the curved portions around a cylinder of the outer string in geometrical stairs. It should be cut out of stuff at least 2 in. thick. Illustrations below show the

WREATHED STRING

DRUM for bending STRING

method of bending and cutting the curved piece of the string around a drum built up of narrow strips glued together on a frame. The wreathed or curved part of the string is either a veneer or made by cutting away all but a thin outer surface of the string until only a thin veneer is left. After this has been bent upon the drum or framed cylinder, wedge-shaped battens are glued on to bring it up to its original thickness and to maintain its new bent shape. After the battens or keys have set, the curved

string is cut for treads and risers. The elevation and plan are shown below of a string prepared for bending. The string being marked for treads and risers before it is bent round the drum, it is necessary to prepare and lay out a pattern or template of its true form.

PLAN & ELEVATION OF STRING before BENDING

Carriages, sometimes termed rough strings, are placed in between the inner and outer strings, and run parallel to them from floor to trimmer. They are used to give intermediate support to the steps and add very considerably to the stiffness of the stairs. Their underside provides a fixing for the laths where the soffit is plastered; in which case they should be spaced apart not more than 15 in. on centres. Creaking stairs denote either the omission of carriages or that the carriages are too weak and sag when weight is put upon them. They should be of a size not less than 2 in. by 3 in., but are better 3 in. by 4 in. and are formed out of rough unplanned stuff. Sometimes the carriages are cut to the angle of the treads and risers, so as to fit tight under the treads and against the inner faces of the risers, but more often they consist of straight timbers of the sizes mentioned, having 1 in. to 2 in. cleats nailed on their sides to support the treads.

TRUE CURVE OF STRING round CYLINDER

SECTIONS OF STAIRS

This form, necessitating no cutting of the carriage, is consequently stronger. In very economical construction the carriages are omitted, and the soffit of the stairs is prepared for plastering by having strips nailed to the lower angular intersection of the steps.

Steps.—The steps being composite consist of a horizontal surface upon which the foot rests, and known as the *tread* and a vertical surface known as the *riser*. The treads and risers are mortised and tenoned, rebated and grooved or housed together, and housed at their ends into the strings.

Fliers.—The parallel rectangular steps in a geometrical stair, as distinguished from irregular-shaped steps such as winders, dancing steps, commode step and curtail steps, are termed fliers. Diminished fliers are those steps next above and below dancing steps, which are narrowed at one end only in order to permit the extra width necessary to enable the centres from which the risers of the dancing steps are struck to be obtained.

Winders are steps, the risers of which radiate from a central point of a single newel post, or from the centre of a cylinder. They are found necessary for the purpose of gaining extra height of ascent with a saving of floor area used. In newel stairs the inner ends of the winders are housed into the newel posts. As the carriage is stopped by the *pitching* piece and cannot be continued to carry the winders, these are supported by means of bearers built at one end into the staircase wall and framed into

the newel at the other. The bearer at the back is flush with that of the riser immediately over it. Cross bearers to support the treads are framed between the risers and the bearers behind them.

Bearers framed round a cylinder, as in geometrical stairs, have a *wreathed string* and cross bearers similar to those used in a newel stair.

In connection with winders the *walking line* is a term used for an arc of a circle having the newel as centre and 18 in. as radius, upon which the winders are set out on plan.

As has been said, winders should only be used where it is desired to be economical of floor area. They increase the cost of construction, being more complicated, and where several are formed radiating from a central newel, they are dangerous on account of the vertical drop formed

at the newel. A rule-of-thumb for safety is that the width of the head of a winder at the walking line should never be less than the width of an ordinary rectangular tread in the straight flight.

DANCING or BALANCED STEPS

Dancing Steps are winders that do not radiate from a common centre. They are provided to overcome in some degree the danger occasioned by having a direct vertical drop of several risers in the height of the newel post. They are sometimes termed *Balanced Steps*, being then diminished fliers having their outer end narrower than the inner or wall end. They are useful also for easing the break between winders and fliers. *Commode Steps* are those the plan of which is a parabolic curve, and are often met with in the bottom step or steps of a geometrical stair.

SKETCH showing WINDERS and COMMODE STEPS

A *Bull-nosed Step* is one with a round quadrant or hexagonal end. The ends of the and curtail steps are formed of shaped blocks made up in three or four thicknesses or built-up blocks covered by the riser face cut to a thin veneer. The joint is secured by wedges and the block being screwed to the thick portion of the riser as shown below.

ALTERNATIVE METHODS of forming BULL-NOSE

Such stairs are often fixed in hallways where an improved appearance is desired, the newel being placed on either the first, second or third riser. One method of bending these risers is that shown above, where a solid block prepared to support the veneer as mentioned above. The solid portion of the riser is screwed to the block, the veneer being bent round the block, two wedges being driven in tight to clamp the veneer to the block after the back of the veneer has been covered with glue.

In another method the veneer extends to the end of the curved portion, and the place of the block supports or shoulders is framed up in sections and nailed together the form required. The veneer is kept in position whilst being glued up by means of hand screws, though where these are not available, as when the work is done out of the shop, it is fastened by means of cleats nailed to the form, pressing the veneer tight all round.

To prepare the end of the riser for bending by a third method known as "kerfing," saw cuts at equal distances are made on the inner face of the riser to leave a thickness uncut on the face equal to the thickness of the veneer to be used, as already described. To find the distance between the saw cuts, which will guarantee the best results in bending, the method is as follows: A cut is made at the first point of bend

KERFING

and marked A above, and from A along the portion to be bent marked AB, equal to the radius of the curve desired. Next bend the wood as far as it will go from the cut at A, the new position of B is marked as C, and the distance between B and C gives the distance apart at which the kerfs should be cut.

(To be continued).

BIRMINGHAM BUILDING EXHIBITION

It is a sign of the vitality of the building and allied trades that in spite of the difficulties besetting them from different directions they are able to support really good exhibitions, either in London or the provinces, year after year. And it is the difficulties under which building is carried out that make exhibitions so necessary if progress is to be made. High labour costs give rise to the invention of labour-saving devices; increased prices of materials, or the inability to secure them at all, result in the production of new materials or more economical methods of making use of what we have; and to the busy architect and builder there is no more convenient way of seeing these latest developments than a visit to an exhibition, where, in the course of a few hours, he can see them collected together and judge their respective merits for himself.

Such an opportunity is now available at Bingley Hall, Birmingham, where the Birmingham and Midland Building and Allied Trades' Exhibition is now open. The opening ceremony took place on Monday afternoon, and the show remains open until September 19. Organised by the Birmingham Chamber of Commerce, this exhibition should provide an attraction to all interested in building within the vast industrial area of the Midlands. The Chairman is the Right Hon. the Lord Mayor of Birmingham (Alderman P. Bower, M.B.E.); the Vice-Presidents include the Presidents of most of the associations in the Midland Counties concerned with building, including Mr. A. E. McKewan, A.R.I.B.A. (President of the Birmingham Architectural Association), Mr. H. H. Crump, (President of the Birmingham Association of Building Trades Employers), Mr. William H. Penn (President of the Midland Federation of Building Trades Employers), Mr. J. Grimson (President of the Birmingham and District House Builders' Association), Alderman S. T. Talbot (Chairman of the Public Works and Town-planning Committee of the Birmingham Corporation), Councillor I. A. Kenning (Chairman of the Estates Committee of the Birmingham Corporation), and Mr. J. E. Wilcox (President of the Institution of Civil Engineers); the Vice-Presidents also include several Borough Surveyors and architects of neighbouring cities and districts.

A special conference hall has been provided for the delivery of lectures on subjects bearing on the building industry, and a series of conferences has also been arranged.

Like the last one or two building exhibitions which have been held, a falling off is noticeable in new methods of building and new materials compared with the exhibitions in the years immediately following the Armistice, when at many stands it was only by stretching the imagination that we were able to realise that the exhibits had anything to do with building at all. The extraordinary variety of systems and materials which were then put forward by their optimistic inventors or sponsors as solutions of all the ills construction is heir to, have had time to be thoroughly tested. Many—the majority, in fact—have been found wanting; a few have proved their worth and are now in general use; others have been developed into something useful.

Thus we find at this exhibition nothing of a revolutionary character, but a great deal that is of sound merit. As will be seen from the following notes of the more interesting stands, the display is a very comprehensive one, covering building materials, constructional steelwork, reinforced concrete, sanitary appliances and fittings, machinery and plant, fittings, paints and varnishes, decorators' materials, heating and lighting plant and apparatus, and road-making plant and materials.

THE OPENING CEREMONY.

The Exhibition was opened by Sir Kingsley Wood, in introducing whom the Lord Mayor of Birmingham said the Exhibition then being

opened was in the front rank of the exhibitions held in Birmingham during recent years. It had been organised by a representative organisation of the professional and trade interests, and the result would be of considerable benefit, not only to Birmingham, but to the Midland Counties and the country as a whole. The primary object of the Exhibition was to stimulate progress in one of the most important social problems of the day and to secure co-ordination of knowledge and science, and a systematic promotion of research in order to assist the orderly development of all the agencies which made for the betterment of the industry. The display presented an exceptionally good opportunity for all interested in building to exhibit their products under the best conditions to the architects and builders of the country. In Birmingham alone there were 20,783 people on the waiting list for municipal houses. So far, they had built 6,500 houses, but that only touched the fringe of the problem, and it appeared that those who were to-day in want of a house would live to see their children grown up into adults before their wants could be satisfied. If the building industry needed an assurance of continuity of work they could find it in the programme of the Birmingham City Council, which had decided to build no less than 100,000 houses within the next twenty years.

Sir Kingsley Wood, M.P., in declaring the Exhibition open, said the housing problem was one of the most difficult of the present time. The position of Birmingham was typical of other great cities all over the country. Even after six years strenuous work our housing difficulties had not been overcome, and there was still a large unsatisfied number of people desiring houses. Thanks to the efforts of a number of people, last year was a record so far as house building was concerned, however, and during the twelve months ended March 31 last no less than 136,000 houses were completed. Of these, no less than 117,000 could be classed as workmen's houses, and that showed that the greater proportion of house building that took place last year was directed to relieving the needs of the poorer classes. By far the greater number of these houses were built by private enterprise. If the rate of building were maintained and the increase continued, the number of houses built this year would be in excess of the number built last year. There was no doubt that some headway was being made. That remarkable success was attributable to a national policy being pursued, and at last we had arrived at the time when we were not only building for the natural increase in population, but were also beginning to catch up with the shortage.

THE STANDS.

"The Builder," Ltd., have a large stand for the display of their publications, including *The Builder*; the new monthly architectural journal, *Architecture*; and the comprehensive *Builder* series of technical books of interest to architects, surveyors, builders, students, clerks of works, foremen, and all concerned with building. A new book on sale here is "Estimating for Small Builders," by J. H. Barns, which will be found invaluable in preparing estimates for building work. The two models of the small houses which were awarded first premiums in an architectural competition organised by *The Builder* a year or two ago are attracting much attention.

Heating and Sanitary Fittings.

With the advent of winter, it is opportune that a good show is made of heating and lighting fittings and apparatus. The rival claims of gas and electricity for alleviating the lot of the housewife are well set out by the CITY OF BIRMINGHAM GAS AND ELECTRICITY DEPARTMENTS, each of whom shows a wide range of domestic appliances, from fires and coppers heated by gas to shaving mugs and flat-irons heated by electricity.

A good variety of ranges is to be seen on the stand of MESSRS. SAMUEL SMITH & SONS, LTD., of Beehive Foundry, Smethwick. These ranges have well stood the test of time, and have proved very successful in housing schemes all over the country. They are made in various patterns and sizes suitable for different size houses, and most of them are embodied in attractive and labour-saving surroundings. They are specially designed to be economical in fuel and to provide all the cooking capacity necessary for a large family.

Safety geysers are shown by MESSRS. THE POLLARD ENGINEERING CO., LTD. (Palace House, Shaftesbury-avenue, W.1). The principle on which these geysers is designed is that the cold water, after flowing up an outer jacket, falls by gravity over a number of trays arranged in the interior and then flows out at the bottom through a spout. The trays are in one unit, and can be easily removed. This geyser is made in two sizes, with an output of $1\frac{1}{2}$ and 3 gallons per minute respectively, and in various finishes—a white enamel finish obviating a great deal of cleaning. A geyser of the same type, but with a wickless paraffin oil stove as the heating unit, is also on view on this stand.

MESSRS. PARKER, WINDER & ACHURCH, LTD., of Broad-street, Birmingham, as befits a firm with one of the largest showrooms devoted to builders' materials in the Midlands, have one of the largest stands in the Exhibition. One part is devoted to heating apparatus, and several attractively-designed fireplaces and surrounds are to be seen here, a Dutch tile pattern looking particularly pleasing. A new grate, known as the "Eagle Bijou," seems to be a particularly serviceable cooking and heating apparatus, and is fitted with a bath boiler at the back. A selection of sanitary goods shown by this firm is particularly noticeable for the care which has obviously been taken to dispense with cleaning wherever possible; porcelain and nickel-plating for baths and taps are freely used, and the same thought for labour-saving is also to be seen in the door and window fittings exhibited. The other section of the stand is dealt with under the heading "Machinery."

MESSRS. JONES & ATTWOOD, LTD., of Titan Works, Stourbridge, have for many years specialised in the production of apparatus for providing domestic hot water supplies, and the result of the experience gained during that period is embodied in the exhibits demonstrated on their stand. The "Domestikatum" is claimed to be the only boiler with a grate which is quite open, and which at the same time heats a room, does the cooking, and supplies hot water for bath and domestic purposes throughout a house. For cases where hot water is the main consideration, the "Bather" boiler is recommended; it is a combined boiler and hot water storage cylinder, and is specially noticeable for the way it has been designed so that every part is easily get-at-able for cleaning purposes. Other exhibits are the "Cultivatum" boiler, specially made for heating green houses, a boiler for heating garages, cast-iron boilers for central heating.

Owing to a belief that copper would affect water supplies to the detriment of health, copper pipes have been but little used for that purpose in the past. This idea has, however, been thoroughly exploded in recent years by eminent scientists, and owing to their cheapness and better appearance copper pipes are now being increasingly used for both hot and cold water services, not only for everyday purposes, but also in hospitals, public institutions and housing schemes. A speciality in light gauge copper tubes for these purposes is being made by MESSRS. THE YORKSHIRE COPPER WORKS, LTD., Leeds, and on their stand is to be seen a selection ranging from $\frac{1}{2}$ in. to $2\frac{1}{2}$ in. in diameter. Demonstrations are being given in support of the claim that they are the easiest type of tube for bending and drifting, and that combined with low initial cost they give a sound and reliable installation.

Mantel registers, chimney-pieces, gas grates and gas mantel registers, gas cookers, and portable stoves are to be seen on the stand of

MESSRS. G. MATTHEWS, LTD., of 89, New Cavendish-street, W.1, and will appeal to those who appreciate a good appearance combined with sound construction and economy.

Those concerned with the construction of small houses or bungalows where saving of space is an important consideration, will be interested in the patent tip-up baths demonstrated by the PATENT TIP-UP BATH CO., of Bath House, Broad-street, Birmingham. When not in use these baths are tipped up on end, on hinges, and may be hidden out of sight in a cupboard.

As is indicated by their title, the HURRY WATER HEATER CO. (39, Broad-street, Birmingham) specialise in apparatus for the rapid supply of hot water, and a good range of such gas and coal heated apparatus is shown on their stand.

An exceptionally cheap selection of bath and sanitary goods are exhibited by the BUDERUS TRADING CO., LTD., of 107-9, Cannon-street, E.C.4, including cast-iron white porcelain enamelled baths, basins, sinks and fittings; cast-iron central heating boilers and radiators; roofing tiles, hollow flooring blocks, white glazed wall tiles, &c. We are informed that the company has large stocks of these goods available in London, and will deliver direct by lorry to any part of the country.

Those who realise the advantages of chemical sanitation compared with more primitive methods will be interested in the stand of the ELSAN MANUFACTURING CO., of 34-35, High Holborn, W.C.1, where the "Elsan" closet is on view. This apparatus may be said to bring town methods of sanitation to the most remote rural area. It is quite odourless, and requires no running water. Two models are made, one for permanent fixture and one of a portable type specially suitable for sports clubs, caravans, camps, and similar uses. The permanent model may be had in single or multiple units, and should be investigated by those responsible for hygiene in schools, factories, or similar buildings in rural areas. On this stand is also to be seen a new oil cooking stove, which operates without a wick and is claimed to be capable of cooking a meal for a family in one operation on one burner.

Materials and Fittings.

The stand of the COURTRAI-DU-NORD TILE CO., & LANGLEY, LONDON (161, Borough High-street, S.E.1), has been specially designed to demonstrate the advantages and appearance of Courtrai-du-Nord, Beauvais, and Marseilles roofing tiles. These three tiles all have a distinctive claim on account of their individuality. The Courtrai-du-Nord, an interlocking tile, has the appearance of a pantile; Beauvais tiles are supplied in various shades from yellowish-brown to deep maroon, the standard colour of rich red being especially attractive. Both on account of their quality and cheapness these tiles have become firmly established in this country, and have been used for a great many housing schemes as well as for larger buildings.

Roofing materials, gutters, down pipes, cowls, ventilators, skylights, perforated metals, ventilators, and other roof accessories are shown by MESSRS. ASH & LACEY (Meriden-street, Birmingham), whose stand also displays a variety of nails, fencing, hollow ware, and sheet metal work.

Bangor, Portmadoc, Westmorland green, Delabole green and grey, and brown natural slates, hand and machine-made tiles, pantiles, Roman pattern, and other clay tiles, shown by MESSRS. THE ASTON JUNCTION CO., LTD (Aston, nr. Birmingham), give an excellent idea of the pleasant effects which these home products give to a house. On this stand are also shown asbestos slates, in grey, red, blue, and russet, Swedish redwood doors, and other fittings.

MESSRS. MELLOWE & CO., LTD., of Corporation-street, Sheffield, demonstrate to good effect the application of metal casements, steel doors, partitions, and sashes to a variety of purposes. The windows are specially effective, and show how they can be used to give an air of distinction, while at the same time admitting the maximum daylight. A new feature is a patent cable-hinge and stay, which allows the casement

to open in such a way that the outside of the window can be cleaned from the inside of the room. A variety of casements specially made for factory work, both of heavy and light sections, are on view.

MESSRS. STANDARD METAL WINDOWS, of Houghton-street, West Bromwich, make a special display of three grades of windows specially designed for housing schemes, and steel windows for shops, factories, and other types of building make a good show.

Some excellent examples of the modern craftsman's work are to be seen on the stand of the MIDLAND JOINERY WORKS, LTD. (Lichfield-street, Burton-on-Trent), where a special feature is made of doors which show not only good workmanship, but also good taste in design. The selection on view comprises French doors, a top-glass front door in Columbian pine, inside doors in the same wood, and inside doors in red deal and Japanese oak. The specimens are only prepared ready for staining, so that the quality of the wood and workmanship can be seen.

Another good selection of doors is to be seen on the stand of the MERCHANT TRADING CO., LTD. (34, Bishopsgate, E.C.2), and here again sound, well-seasoned wood, and first-class workmanship are the keynote. The exhibits are made of Columbian pine, of which the company carries large stocks in London and Liverpool. The ovolo moulding is so designed that it shows up the beauty of the panels, and at the same time cannot harbour dust. The stand itself is formed of Douglas fir plywood, stained to bring out the natural beauty of the grain of the wood; this plywood is made up of three cross-plyed layers of wood of equal thickness glued with waterproof cement.

Cheapness combined with sound construction and workmanship is the chief claim for the "Woco" door, and that this is appreciated by purchasers is proved by the very large number of these doors which have been used on the housing schemes of local authorities. The stand of the "Woco" Door Co. (Dashwood House, London, E.C.2), comprises a large selection of these well-known doors, so exhibited that they can be thoroughly examined. A superior door is shown, in the "Woco Laminex," which is made by a special process, whereby thin ribbons of Columbian pine, strengthened with waterproof cement, are crossed and welded together under a pressure of about 200,000 lbs. These doors, besides being exceptionally strong, have a particularly good appearance, and it is claimed that they will not warp or shrink when subjected to severe tests by heat, pressure, or water.

The series of well-known reinforcements manufactured by the EXPANDED METAL CO., LTD., of York Mansion, Petty France, S.W.1, is well displayed, and its uses illustrated by photographs of a few of the many works on which they have been used. For concrete floors, bridges, foundations, and heavy work generally, there is "Expamet" expanded steel reinforcement, which has been so extensively used during the past thirty years, and a mesh of similar manufacture specially produced for concrete roads and pavings. For works which call for specially heavy reinforcement, such as roads or rafts on unreliable soil, or soil liable to subsidence, there is a new treble-layer expanded steel reinforcement with a centre corrugated layer. Reinforcements are shown for brick and concrete-block work and for concrete kerbs, the latter acting as a protection as well as reinforcement. A new product of this company, known as "Ribmet," is also shown, and should be specially useful for use in the construction of small-span roofs and floors. It is of the combined reinforcement and centering type, the concrete being applied without the use of shuttering or close-boarding. The possibilities of this material for partitions and ceilings are shown by sections, and the saving which may be effected with its use by the elimination of expensive timber formwork will be obvious.

As usual, MESSRS. BELL'S POILITE & EVERITE CO., LTD. (59½, Southwark-street, S.E.), have a comprehensive display, including all their

asbestos specialties, which may be tested on the spot to prove the claims which are put forward on their behalf. Slates and tiles, flat and corrugated sheeting, combine to make an attractive show, and to demonstrate the artistic possibilities of this comparatively new but well tried material, while a testimony to its strength is to be seen in a photograph of a group of men standing in the centre of a suspended sheet. A special display is made of rainwater goods, gas flues, and suchlike uses of asbestos-cement, a use which is increasing amongst those who realise the value of the material as one which needs no painting or other maintenance expense. Asbestos-cement products of this type are not only non-corrosive but are stated to be actually stronger than cast-iron.

Asbestos-cement goods are again shown to advantage on the stand of MESSRS. TURNER BROS. ASBESTOS CO., LTD., of Rochdale, which takes the form of a pavilion in which as many as possible of their products are displayed in position on the roof and walls. The specimens include "Trafford" tiles 4 ft. by 3 ft. 8 in. for large roof areas, and a new tile for the same purpose measuring 24 in. by 12 in.; a tile in three colours, giving a pantile effect; diagonal slates in grey, blue, red, and russet brown; rough surface English pattern slates in different colours; plain and corrugated sheets, &c. A lasting, pleasing, and economical roof or walling may be built of these materials.

The stand of the BRITISH FIBROCEMENT WORKS, LTD. (Erith, Kent) has also been specially designed to demonstrate the application of their products in a practical manner. Here are to be seen asbestos-cement products for practically every purpose for which they can be used in building, including slates and tiles, flat and corrugated sheets, panel sheeting, high pressure jointing, boiler and pipe coverings, &c. The stand well illustrates the attractive appearance of asbestos-cement when judiciously selected for colour values.

With the appliances shown by the SIMPLEX FLOOR PLANING TREATMENT CO., LTD., of 7, Finch-street, London, E.1, the most disreputable and worn wooden floor can be made to look as new. There are three machines to complete the process, all electrically driven. The first is a planing machine for levelling the floor, followed by a sandpapering machine which leaves a smooth and splinterless surface. Wax is then applied, and worked to a hard and durable surface by a polishing machine. These machines may be used on all types of wooden floors, and are fitted with exhausting devices which automatically collect shavings and dust and deposits them in a container.

A manufactured product which has every appearance and many of the properties of real marble is demonstrated by MESSRS. THE MANU-MARBLE CO. (Taffley-crescent, Gloucester). The material is in fact reconstructed marble, and has practically the same chemical composition as real marble. It has the advantage, however, of being considerably cheaper, and should thus prove a useful decorative material where the price of marble would make its use prohibitive. It is almost impossible to distinguish "Manu-Marble" from the real thing, and even the veins go right through the slabs. Again, like marble, the surface of the reconstructed product is polished by friction, so that a damaged surface can easily be made good. In addition to its uses in building construction, such as the interior decoration of cinemas, theatres, banks, public buildings, &c., it is also used for floors and for lining the walls of lavatories, bathrooms, &c.

"Granwood" blocks and slabs, an alternative to tiles, are exhibited by the GRANWOOD FLOORING CO., LTD., of 158, City-road, E.C.1. These blocks, which are made in one size, 6 in. by 2 in. by ½ in., form a durable and hygienic flooring, and are made in different colours so that they can be arranged in patterns if desired. They are also used for fireplace surrounds, which the manufacturers supply complete.

Scaffolding.

Everything in the way of scaffolding plant is supplied by MESSRS. SCAFFOLDING (GREAT

BRITAIN), LTD., of 43, Lansdown-road, London, S.W.8, and a good selection of their products is to be seen here. A special feature is made of tubular scaffolding and this firm's patent method of tubular steel construction. The latter may be advantageously used for all types of buildings, and is being largely adopted by leading builders for temporary stagings, huts, canteens, &c., on account of its cheapness over a period when compared with wood erections which must inevitably result in the cutting to waste of a good deal of timber when they are dismantled and re-erected for a different purpose or on a different site. The parts are interlocking, and simple to erect and take down. "Scaffixer" scaffold ties, and a particularly strong and durable type of suspended scaffold are on view, as well as a variety of more usual scaffolding plant. Demonstrations of the various exhibits are given.

In addition to the ladders and steps for all purposes for which they are well known, MESSRS. DREW, CLARK & Co. (Leyton, E.10) are making a special show of their new "Raprig" patent scaffold. For interior painting work in buildings where a great deal of scaffolding is necessary it will sometimes be found that the cost of providing, erecting, and dismantling the necessary scaffolding will amount to 50 per cent. or more of the total, and it is for such work that this new method has been devised. It is built up on a unit system so that with an adequate equipment it can be used for works of any magnitude. Also, it may be erected on wheels, so that if it is used for, say, a large ceiling area it can be moved along as the work progresses without being taken down at all. We understand that this scaffolding is already being extensively used by different Government Departments. It is claimed to be 50 per cent. cheaper than pole-and-cord scaffolding, and deserves the attention of master decorators who carry out work involving any considerable amount of scaffolding.

"Acme" telescopic extension ladders provide the chief feature of interest on the stand of the ACME PATENT LADDER CO., of Earlsfield. These are made in a variety of sizes and patterns suitable for different requirements, and are now well-known to the building and decorating trades. Various types of ladders and steps, trucks, trolleys, barrows, and scaffold trestles are also exhibited on this stand.

Paints and Varnishes.

The excellent work of the BIRMINGHAM & DISTRICT PAINTERS' AND DECORATORS' JOINT COMMITTEE is clearly to be seen in the exhibits on their stand. The lettering, sign-writing, heraldic work, colour decoration, &c., here to be seen give an idea of what can be done when proper training and guidance on right lines are available, and make one wish that more of this class of display work were to be seen in our streets instead of the deplorable signs so often to be seen, which, while apparently satisfying the owner, are an eyesore to every passer-by.

Amongst the products of MESSRS. ROBERTS, GLAZEBROOK & Co., LTD., of Tyseley, Birmingham, prominence is given to their well-known speciality "Glazebrook's No. 1 Flat White" for undercoating and flat oil-finishing. A new product is "Permoglaze," a liquid glaze for walls; when applied to brick, plaster or concrete it gives a hard and tile-like surface which can be washed and does not chip or soften. Other exhibits are a paint for metal which should interest those concerned with the protection of iron and steel structures, corrugated iron buildings and roofs, &c.; a high-gloss paint with an enamel-like finish for indoor or outdoor work; a durable white enamel; finely-ground colours in oil, varnishes, &c., the whole making a display of exceptional interest to those interested in the decorating and preservation of buildings.

To show that there is no noticeable difference in the appearance, finish, and "feel" of surfaces treated with paint mixed with "Decco" turps and those in which other thinners are used, the ALICO-PETROLEUM, LTD. (Alexandra House, Queen-square, W.C.1), are displaying in a practical manner a series of panels on which

different types of thinners have been used in the painted finish.

MESSRS. THOS. PARSONS & SONS (315-17, Oxford-street, W.1) have arranged a series of panels to show what a high degree of perfection can be obtained with their various paints and varnishes. These include all kinds of materials used in building and decorating work, such as undercoating, scumbling, flat wall paints, enamels, and varnishes. A new product is "Parsoglaze" scumbling paint, which is an easily handled paint giving an excellent broken colour effect.

Dry paste for mixing with cold water, concentrated size in powder form, soap powder, liquid cold-water glue, and similar products made up in packets containing small quantities are exhibited by MESSRS. KIRKWOOD, CRAIG & Co., LTD. (Eighth-avenue Works, Manor Park, E.12).

Samples of white and red lead are exhibited by the old-established firm of LOCKE, BLACKETT & Co., LTD., of Newcastle-on-Tyne, who specialise in its manufacture. Litharge, sheet lead and pipe are also included in the display to be seen on this stand.

Machinery and Plant.

A new concrete mixer exhibited here, we believe, for the first time, is shown by the RANSOME MACHINERY Co. (1920), LTD., of Windsor House, Victoria-street, S.W.1. This is a featherweight machine which should specially appeal to builders and road contractors. Mounted on a pair of road wheels of large diameter, the open mixing drum is perfectly balanced, and may be loaded or discharged from either side. It is driven by a 1½ h.p. petrol engine, arranged so as to be easily accessible. The capacity is 4 cub. ft. per batch, and the machine may be easily transported by one man. Other well-known specialties of this firm, such as the "Lightweight" mixer, a hand-power moulding press for the manufacture of all kinds of concrete products, tip-carts in steel, roof trusses, are also exhibited.

Another new machine is the combination slab, block and brick machine shown by the LINER CONCRETE MACHINERY Co., of Newcastle-on-Tyne. This is a particularly sound proposition for the small builder, being strongly built and simple in operation. This firm's large stone-moulding machine, which will manufacture products up to about 5 ft. in length, or which by inserting liners can be adapted to the multiple manufacture of smaller concrete units, is also on view. Both these machines are shown in operation.

A selection of the engines and pumps for which they are well-known is shown by MESSRS. TANGYES, LTD., of Cornwall Works, Birmingham. These include a heavy-fuel oil engine, a vertical petrol engine mounted on skids, a centrifugal pump, a double-lift hand hoist, chain lifting blocks, and screw and hydraulic lifting jacks.

"Fowler" mixers, the special feature of which is their strong construction, are shown in different patterns by MESSRS. JOHN FOWLER & Co. (LEEDS), LTD., of Leeds. Two patterns are on view, namely, the standard 10-7 model and a 6-4 model fitted with a 10 cwt. friction winch. The drums of these mixers are made of two different metals, the portion subject to the hardest wear being a semi-steel casting and the sides of pressed steel plate. Power loaders are fitted to both models.

Among the exhibits on the stand of MESSRS. BUILDERS' & CONTRACTORS' PLANT, LTD. (11, Victoria-street, S.W.1) the "Exe" patent hoist is attracting considerable attention on account of its labour and time saving possibilities. This hoist has been in use for some years now, and the firm is able to point to a large number of important contracts on which it has been, or is being, used. It is made in two sizes, one with a lifting capacity of 10 cwt. at a speed of 200 ft. a minute, and the other with a capacity of 5 cwt. Also to be seen here are the "Roll" concrete mixer, which mixes the batches by centrifugal force and gravity without the use of paddles in the drum. A new product of this firm is an all-metal machine (hand-operated) for the manufacture of concrete blocks, slabs,

or bricks; this is a strong, simple and inexpensive machine which should appeal to those builders who realise the advantage of having a machine which is practically indestructible and foolproof when it is to be operated by unskilled labour. Tipping carts, steel barrows, a clinker breaker, winches and general builders' equipment are other features of this stand.

Apart from its simplicity of construction, the most noticeable feature of the "Empire" concrete mixer shown by MESSRS. PARKER, WINDER & ACHURCH, LTD., of Broad-street, Birmingham, is the fact that the drum may be charged and discharged from either of three directions, namely, the front and each side. It is of the open drum type, mounted on a wheeled truck, and is adapted for hand or power operation. This firm's "Excelsior" screens are now well-known, and have the advantage that the blades are wedge shape so that there is no possibility of the screen becoming choked with the material. A rotary screen, with the blades made on the same principle and adapted for hand or power drive, is also on view. Another section of this stand is devoted to fencing, and three kinds are exhibited; a woven wire fence, strongly made, and specially suitable for enclosing large areas; a diamond-mesh wire fencing supplied in various meshes and of different heights; and a paling, with a rustic appearance, such as has been used for so many housing schemes.

Woodworking Machinery.

As usual, MESSRS. J. SAGAR & Co., LTD. (Halifax) show a wide range of useful wood-working machines, several of which will appeal to the builder, and are here to be seen in operation. Included in the selection on view are a combined hand and roller-feed surface planing, thicknessing and moulding machine for planing out-of-twist, making glue joints, bevelling, and chamfering, rebating, tonguing, grooving, moulding, &c.; a circular saw bench for light and general work; a circular saw bench with rising and falling table for general sawing, deep cutting, ripping, cross-cutting, bevel-cutting, rebating, tonguing, and grooving, sticking beads and small mouldings, boring, &c.; a band-sawing machine for straight or curved work; a builders' tenoning machine which is also convenient for cross-cutting and grooving; and machines for mortising; moulding outlines; planing and thicknessing framing, panels, boards, and heavy timber, sawing, cutting, grooving, rebating, &c., boards up to 36 in. wide; dovetailing, &c. A machine for grinding and sharpening cutters and joiners' tools is also exhibited, the whole forming a display from which a machine suitable for practically any purpose may be selected.

On the stand of MESSRS. PERKINS & Co., LTD. (Junction Works, Whitehall-road, Leeds), the attention of the builder will probably be chiefly directed to a new stair housing attachment for use on a vertical spindle moulder. It is claimed that this machine can in 25 minutes rout a pair of stair strings that would take a joiner eight hours to do by hand. The attachment is listed at a low price, and should be seen by all interested in reducing joinery costs.

MESSRS. GULLIET, SONS, & Co. (13A, Finsbury-square, London, E.C.2), have a comprehensive selection of wood-working machinery on view, including a few hand-power machines and a belt-sander suitable for sandpapering panels, doors, &c., with rise and fall table.

Miscellaneous.

Fire-extinguishing appliances of practically every description are to be seen on the stand of MESSRS. CHARLES WINN & Co., LTD., of Granville-street, Birmingham. The "Simplex" extinciteur, so often to be seen in important buildings, is designed to meet the requirements of the Board of Trade, the Fire Office Committee, and the Fire Brigade, and provides a ready means of extinguishing fires before they become serious enough to do much damage. Hose, couplings, pipes, hydrants and hydrant fittings, and special fittings for motor fire-engines go to make up a very comprehensive exhibit of fire-protection apparatus. Messrs.

Winn devote a portion of their stand to a display of sanitary goods and fittings.

MESSRS. ALLEN-LIVERSIDGE, LTD., (Victoria Station House, Westminster, S.W.1) make a special display of a welcome improvement in methods of lead burning, for which purpose they have put on the market a method embodying the use of oxy-acetylene. A thorough series of experiments has shown that the amount of dissolved acetylene required for welding sheet lead is only 25 per cent. of the volume of coal gas and only 15 per cent. of the volume of hydrogen necessary for the same amount of work, and that the volume of oxygen consumed is only 50 per cent. of that consumed with either of the other methods. We are informed that this process is effecting a saving of about one-third compared with the two older methods.

The elimination of cords, pulleys, and unsightly gear for windows is achieved by the "Skylux" method of window opening gear shown by MESSRS. SKYLUX, LTD., of 22, Gt. St. Andrew's street, W.C.2, which can be applied to both wood and metal sashes of whatever size or wherever placed. An idea of the adaptability of the system will be realised when it is said that it has been used for small houses and also for the very long spans of opening roof-lights at the new Olympia Annexe.

The "Rawlplug" method of fixing screws into hard substances such as brick, concrete, tiles, &c., shown by the RAWLPLUG CO., LTD., (Gloucester House, Cromwell-road, S.W.7) is too well known to need description. This firm is, however, showing several new products, a particularly useful one being a device for fixing machinery down to concrete floors or for suspending shafting from concrete beams.

MESSRS. MORRIS COMMERCIAL CARS, LTD., (Foundry-lane Works, Soho, Birmingham), show one of their 1-ton general purpose vehicles which should make a special appeal to the builder who requires a light van for his business. It has a usual pattern hand tipping screw for the body, which has a length of 7 ft. 6 in., and a width of 5 ft. 6 in.

The products of MESSRS. W. T. NICHOLSON & CLIPPER CO., LTD., of Salford, Manchester, including belt-lacing machines, belt fasteners, wire tools for belting, mallet tools for use with belt fasteners, and belt cutters, are shown in profusion, and demonstrate the claim of this firm that they supply everything for the user of belt drives.

Safes, strong-room doors, strong-room shelving and other burglar and fire-proof fittings are shown by MESSRS. SAMUEL WITHERS & CO., LTD. (Park Works, West Bromwich). This firm's "Grip" doors are not fitted until the masonry is completed, and it is therefore only necessary to leave a rectangular hole of the required size.

The advantages of their belt-treating compounds and jointing materials are demonstrated in a practical manner by MESSRS. THOMAS & BISHOP, LTD., (37, Tabernacle-street, E.C.2), who also show a selection of high quality leather and textile beltings for various purposes.

In addition to their well-known waterproofing paints and compounds, an exhibit of special interest on the stand of MESSRS. CURRASS PRODUCTS, LTD., (Abbey House, Victoria-street, S.W.1) is a method of treating worn and leaking corrugated iron or zinc roofings by patching with a fabric, such as canvas. The metal is first coated with the firm's "No. 6 liquid," to which a sheet or strip of fabric is applied. The fabric adheres to the liquid, and a further coat is then applied to the outside of the fabric; the result being a weather proof repair job at a very low cost.

Birmingham has a particular significance in connection with "Easilit" blow-lamps, as they were first exhibited there in 1908, and we are informed that some of these original lamps are still in use in good working order in the city. In addition to these burning-off and plumbers' lamps, the EASILIT BLOW LAMP CO., LTD., of Watford-road, Kings' Norton, Birmingham, show plumbers' stoves of petrol or paraffin, a machine for cutting mitres at different angles in Lincrusta and other borders, and an egg-shell gloss varnish.

NEW BUILDINGS IN LONDON.

Barking.—The "Crooked Billett" public-house at Creeksmouth, Barking, is to be rebuilt for Messrs. Charrington & Co., Mile End Brewery, E.1. Messrs. George Porter & Sons, Ltd., builders, 124, Sumner-road, Peckham, S.E. Mr. Samuel A. S. Yeo, F.R.I.B.A., Bank-chambers, St. John-street, E.C.2.

Barking.—Extensions are to be carried out to the works of the Cape Asbestos Co., Ltd., at Hart's-lane. Mr. E. L. Haynes, architect, 123, Newgate-street, E.C. Messrs. W. F. Blay, Ltd., builders, Dowgate-hill, Common-street, E.C., and Dartford, Kent.

Bishopsgate.—On the important freehold property, 203-211, Bishopsgate, having a frontage of about 100 ft., it is intended to erect a large office building and business premises with shops on the ground floor. Mr. Paul Hoffmann, Capel House, New Broad-street, E.C.2, architect.

Charing Cross.—The premises at Nos. 22-24, Charing Cross, S.W.1, are being converted into offices, with lift, and two shops on ground floor. Messrs. Bovis, Ltd., builders, 43, Upper Berkeley-street, W.1.

City-road.—The Royal London Ophthalmic Hospital in City-road, E.C.1, are raising £10,000 for the purpose of extensions. Messrs. Young & Hall, architects, 17, Southampton-street, W.C.1.

Ebury-street.—Steelwork has now been placed in position for the extension of the Goring Hotel, in Ebury-street, S.W.1, by Messrs. Dorman, Long & Co., Ltd., 3, Central-buildings, Westminster, S.W.1. The floors are to be constructed by Messrs. The Kleine Patent Fire-Resisting Flooring Syndicate, Ltd., 133, High Holborn, W.C. Messrs. Dove Bros., Ltd., builders, Cloudesley-place, N.1. Messrs. Giles, Gouch & Trollope, architects, 28, Craven-street, W.C.2.

Epsom.—A new hall, to cost about £7,000, is to be erected for the Epsom Brotherhood Movement. Mr. A. C. Williams, architect, Ashley-road, Epsom.

Fleet-street.—Nos. 22, 23 and 24, Bride-lane, and Nos. 2 and 7, Bride-court, are to be demolished to make room for a new block of buildings which Messrs. J. Lyons & Co., Ltd., are to erect in connection with the extension of their Ludgate-circus shop.

Fleet-street.—The site of No. 124, Fleet-street, E.C.4, covering about 4,200 feet, is to be let on building lease for a term of years. The surveyors and agents are Messrs. St. Quinten, Son & Stanley, 34, Clements-lane, E.C.3.

High Holborn.—The lease which has been acquired by the British Bureau, Ltd., 19, Abingdon-street, S.W.1, of Nos. 95-99, High Holborn, and 14-17, Eagle-street, W.C.1, as a site for "Monomark House," stipulates that not less than £75,000 shall be expended on rebuilding within the next ten years.

Jermyn-street.—A block of residential flats and shops is to be erected in Jermyn-street, W.1, to plans prepared by Messrs. Yates, Cook & Darbyshire, 43, Great Marlborough-street, W.1. Steelwork by Messrs. Archibald D. Dawney & Co., Ltd., Steelworks-road, Battersea, S.W.

King William-street.—Extensive alterations are being carried out at Messrs. Gatti's Restaurant in King William-street and Strand, W.C. Messrs. Higgs & Hill, Ltd., builders, Crown Works, South Lambeth-road, S.W. Steelwork by Messrs. Smith-Walker, Ltd., 33, Tothill-street, S.W.1.

King William-street.—Messrs. B. Goodman, Ltd., Haggerston-road, N., are clearing the site in King William-street, E.C.3, bounded by Nicholas-lane and Nicholas-passage, upon which it is proposed to build the new head offices for the London Life and Clergy Mutual

Insurance Co. Mr. W. Curtis Green, A.R.A., architect, 5, Pickering-place, S.W.1.

Kingston.—The Governors of the Kingston Grammar School propose to spend about £13,000 on new classrooms, assembly hall and cloakrooms. Messrs. Jarvis & Richards, architects, 60, Tufton-street, Westminster.

Lambeth.—The South London Palace Varieties in London-road, S.E.1, owned by the Variety Theatres Consolidated, Ltd., 25, Charing Cross-road, W.C., has been closed for reconstruction at a cost of about £50,000. Messrs. Griggs & Son, builders, 100, Victoria-street, S.W.1. Work to be carried out under the direction of Mr. Cecil Masey, 18, Devereux-court, Strand, W.C.2.

Limehouse.—Messrs. W. J. Maddison, Ltd., 124-127, Minorities, E.1, are the contractors for the rebuilding of the St. Paul's School in St. Paul's-road, Limehouse, E., at a cost of £30,000. Mr. G. Topham Forrest, F.R.I.B.A., County Hall, S.E.1.

Mansion House.—Extensive alterations and improvements are being carried out by Messrs. Sims & Russell, Bloomsbury-street, W.C., at Mansion House District Station, E.C.4, for the Metropolitan District Railway Co. Plans by the Company's architect, 55, Broadway, S.W.1.

New Bond-street.—The site of the new premises at the corner of New Bond-street and Burlington-gardens, W.1, for Messrs. J. & P. Atkinson, Ltd., perfumery manufacturers, has now been taken over by the contractor Messrs. E. A. Roome & Co., Ltd., Warwick-street, E.9. Steelwork will be by Messrs. Archibald D. Dawney & Sons, Ltd., Steelworks-road, Battersea, S.W. Messrs. Stanbrough & Harris, architects, 29, James's-square, S.W.1.

New Bond-street.—Important improvements are to be made to the Æolian Hall, in New Bond-street, W.1. Messrs. Griggs & Son, contractors, 100, Victoria-street, S.W. Joinery and metal work to be installed by Messrs. Samuel Haskins & Bros., Ltd., Watnamstow, E.17.

Piccadilly.—The site at one corner of Piccadilly and Bolton-street, W.1, has been cleared for the erection of a large block of shops and flats. Messrs. Griggs & Son, contractors, 100, Victoria-street, S.W.1. Messrs. Trehearne Norman, architects, Windsor House, King's-way, W.C.2.

Putney.—Extensions are to be carried out to the works of Messrs. Joseph Thorley, Ltd., cattle food manufacturers, Point Pleasant S.W.18. Messrs. Holliday & Greenwood Ltd., contractors, Stewarts-road, Battersea, S.W. Mr. G. E. F. Smedley, architect, T. Island, Rickmansworth.

Regent-street.—New premises, consisting of a large restaurant and shops, with office above on five floors, are to be erected at the corner of Regent-street and Air-street, W.1, for Messrs. Stewarts. Messrs. Howard & C. builders, 3, Broad Court-chambers, W.C. Steelwork by Messrs. H. Young & Co., N.1. Elms Ironworks, S.E. Masonry will be erected by Messrs. Dawe Bros., Culvert-place, S.W. Messrs. William Woodward & Sons, architects, 15, Gt. James-street, W.C.1.

Regent-street.—Quadrant House, a block of shops and offices, is being erected on western side of Regent-street, W.1, to designs of Messrs. Yates, Cook & Darbyshire, 43, Great Marlborough-street, W.1. Messrs. Holliday & Greenwood, Ltd., contractors, Stewarts-road, Battersea, S.W.

Regent-street.—The main stanchions being erected for the superstructure of the Regent Arcade in Regent-street and Air-street, W.1. Messrs. Kirk & Randall, J. contractors, 146, Grosvenor-road, S.W.1. S. Gordon Jeeves, architect, 16, Hanover square, W.1. Quantities by Mr. W. Webber, 33, Furnival-street, E.C.4.

Stamford Hill.—A new picture theatre is to be erected on the site at the corner of St.

ford Hill and Clapton Common, E.5. Messrs. D. Morris & Sons, architects, 91, Moorgate, E.C.2.

Tottenham.—Premises in Lawrence-road, N., have been acquired by Messrs. Pictos. Ltd., for use, after extensive alterations and equipment, as cinematograph film laboratories. Mr. E. A. Stone, F.S.I., architect, 20, Berkeley-street, W.1.

Victoria-street.—The premises adjoining the Army and Navy Co-operative Society's Stores, in Victoria-street, S.W.1. including the Army and Navy Mansions, are shortly to be taken over by the Society. Improvements projected include an extension of the range of shop fronts and showrooms. Sir Aston Webb & Sons, architects, 19, Queen Anne's-gate, S.W.1.

Wandsworth.—A group of 40 houses is to be erected on the Southfields housing estate at Wandsworth, S.W. Messrs. G. I. & H. B. Elkington, architects, 7, Laurence Pountney-hill, Cannon-street, E.C.4.

Wembley Hill.—A new church hall and vicarage are to be erected in a new parish of St. Michael, at Tokington, Wembley Hill, at a cost of about £20,000. Mr. G. Percy Pratt, architect, 174, Acton High-street, W.3.

With regard to the paragraph in our last issue under New Buildings in London, referring to the new building for the International Fur Company, in Regent-street, we are asked to state that the contract for the steelwork is being carried out by Messrs. Moreland, Hayne & Co., Ltd., and not by Messrs. H. Young & Co., as stated.

BAD WEATHER BUILDING INSURANCE SCHEME

The National Federation of Building Trades Operatives have formulated a scheme for the payment of time lost through inclement weather. As submitted to the employers, the proposal provided for an employers' contribution of 1s. a week for every operative, paid into a central fund called "The Inclement Insurance and Welfare Fund," for which a special account would be opened by the Operatives' Federation, who would be responsible for its administration. The employers were to have the right to appoint an accountant periodically to inspect the books. To build up a fund it was proposed that no payment should be made until an agreed period after the initiation of the system of contributions. Payment, it was suggested, should be of a maximum sum of 50 per cent. of the actual time lost by the operatives or such lesser amount as the fund would allow in respect of wet weather. It was further recommended that after the scheme had been in operation for an agreed number of years, and the average calls on the fund could be properly estimated, any surplus should be utilised for the purpose of assisting welfare schemes in the interests of workmen engaged in the building trades.

Mr. R. Coppock, the Secretary of the Federation, writing in the *Operative Builder*, states that as the result of study of the proposals by a joint committee, the employers who had opposed the idea of payment for lost time began to change their views, and it was agreed that it might be possible to reduce the contribution from 1s. to 6d. "The operatives," he adds, "quite rightly consider that this question is not merely one of profit and loss, but that the cost to the industry must be subordinated to the more vital issue of decasualising labour." Mr. Coppock adds that a scheme of this kind has got to be a matter of round-table negotiation in the end and cannot rest on any but an actuarial basis.

We learn that owing to a fire the works of the National Bituminous Products, Ltd., of 67A, Aversham-road, Reading were completely gutted on Monday last. It is understood, however, that the firm will do their very best to execute orders that are sent to them at 28, Victoria-street, S.W.1.

RATES OF WAGES IN THE BUILDING TRADE

Every endeavour is made to ensure accuracy, but we cannot be responsible for errors.

CONTRACTS, COMPETITIONS, &c.

For some contracts still open, but not included in this List, see previous issues. Those with an asterisk are advertised in this number. Certain conditions beyond those given in the following information are imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in; the name and address at the end is the person from whom or place where quantities, forms of tender, &c., may be obtained.

PROPOSED NEW BUILDINGS & OTHER WORKS.*

In these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works at the time of publication have been actually commenced. Abbreviations: T.C. for Town Council; U.D.C. for Urban District Council; R.D.C. for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; B.C. for Borough Council; P.C. for Parish Council; M.H. for Ministry of Health; M.T. for Ministry of Transport; C.B. for County Borough; B.E. for Board of Education; M.A.B. for Metropolitan Asylums Board; and M.W.B. for Metropolitan Water Board.

ABRAM.—Funds are being raised by the parishioners of Abram Parish Church for alterations at St. John's day school.

ACCRINGTON.—Funds are being raised for proposed extensions and a new nurses' home for the Victoria Home, the estimated cost being £40,000.

ALLERTON BYWATER.—The West Riding C.C. are proposing to erect a new public elementary school, with accommodation for 450 children. The site is at Great Preston. The plans are in course of preparation by the architects' section of the Education Department, Wakefield. Plans have been prepared by Messrs. Garside & Pennington, architects, Ropergate, Pontefract, for the erection of a mission hall at Bowers Row, Allerton Bywater, for the trustees.

ARDSLEY.—The Council is applying to the M.H. for sanction to borrow £3,260 for the drainage of certain portions of the West Ardsley Ward, and of improvements at the Fall Sewage Works.

ADENS A.W.—S. Hadfield is to erect 15 houses and a shop in Droydsden-road. Manchester Corporation are to erect an electricity sub-station in Delta-road.

BALROTHERY.—The Dublin R.D.C. has decided to build 52 cottages, from 270 to 300 each.

BILTINGHAM.—The U.D.C. has decided to make application to the Public Works Board for a loan of £5,000 for the erection of additional houses on the Chilton-lane site.

BINGLEY.—The M.H. have held an inquiry, in connection with the application of the U.D.C. for permission to proceed with the public swimming baths project, and also for borrowing powers to the extent of £27,000, the estimated cost of the work.

BIRKENHEAD.—Messrs. Cammell, Laird, shipbuilders, are to spend £150,000 on extending and rebuilding their old slipways.

BLACKPOOL.—Funds are being raised for a new vicarage and renovation of St. Thomas's Church, at an estimated cost of £1,000.

BOLTON.—The T.C. passed plans: Leigh Bros., Ltd., two houses, Kingston-avenue, four houses, Shelbourne-avenue, 10 houses, Kingston-avenue; E. Taylor, Son & Co., eight houses, Hampton-road; T. Blakley, eight houses, new road, off Green-lane, two houses, Rish-ton-road; J. S. Hughes, fourteen houses, Normanby-street; E. Howarth, six houses, Lever Edge-lane; Ainsworth, Son & Co., transformer house, Halliwell Bleachworks.

BRIGHTON.—The new Sussex Hospital for Women and Children is appealing for £25,000 to enable a new wing for 30 beds to be built.

BRISTOL.—Bristol Housing, Ltd., have arranged to lay out a site near Soundwell-road and Two Mile-road for dwellings; the estate is to be developed on town-planning lines. The Bristol Diocesan Church Extension Committee have purchased a site of 1½ acres on the Speedwell estate for the erection of a church and church buildings.

BURNLEY.—Plans passed by the T.C.: Conveniences at Marley Shed, submitted by M. Kippax & Sons, Ltd.; urinal in Boathorse-lane, submitted by the Health Committee; school in Lionel-street, submitted by the T.C.; gas works at Old Hall, submitted by the Gas Committee. The Housing Committee propose to build 14 more houses on the Palace House site at an estimated cost of £13,000.

BURTON-ON-TRENT.—The Corporation have acquired land at High Bank for the erection of about 100 houses, and tenders are to be invited for sewer works estimated to cost £2,000.

BUXTON.—Norfolk E.C. has arranged for the enlargement of the mixed school, at a cost of about £1,000.

CAERPHILLY.—The G.W.R. Railway Co. propose to erect 200 houses at Caerphilly. Plans are being prepared by the Railway architect's department.

CARLISLE.—The Corporation schemes for the construction of new bridges at Roath Park, include the erection of two bridges, one at Lake-road West, and the other at Lake-road East. The cost of the work, including road improvements, will be about £30,000.

CHERTENHAM.—The Borough Engineer is to prepare plans for an underground convenience at Promenade and Garden.

CHORLEY.—The M.H. has approved plans for a public swimming bath, at an estimated cost of £19,000. The Chorley Joint Hospital Board has approved plans for central heating at an estimated cost of £200.

CLAYTON (BRAIFORD).—The U.D.C. are seeking the M.H.'s approval to erect 12 houses on the Central housing estate.

CLITHEROE.—The B.E. is to visit the town in order to inspect sites for two schools.

CLOUGHFOLD.—Funds are being raised for the proposed extensions to the Cloughfold Wesleyan School Chapel, at an estimated cost of £1,200.

COLNE.—Sanction has been received from the M.H. for the borrowing of £29,474 in connection with the Haverholt Housing Scheme.

DEVON.—The condemnation by the B.E. of a number of church schools in Devon will necessitate their replacement with a series of new buildings, the cost of which is put at from £3,000 to £6,000 each.

DONCASTER.—The plans for the new infirmary have been approved by the Building Committee of the T.C.

DUBLIN.—The Local Government have held an inquiry into the application of the City Commissioners for sanction to a loan of £664,787 17s. 0d. for the erection of working-class dwellings on an area lying between Drumcondra and Glasnevin.

DUNSCROFT (YORKS.).—A site has been acquired for a transformer station, for the R.D.C.

EASINGTON.—An inquiry has been held into the application of the R.D.C. for sanction to borrow £40,000 for a sewerage scheme.

EASTBOURNE.—The T.C. are negotiating with Lord Willington for the purchase of 150 acres of land on the Crumbles on which to erect houses for the working classes.

ELLESMERE PORT.—The U.D.C. has launched a scheme of town improvements which with a recreation ground as a central idea, will include tennis courts, bowling greens, croquet lawns, a bandstand, and a children's paddling pool. The lay-out plan has been prepared by the Surveyor.

ELSECAR.—Extensions are to be made at the Park, and include a new shelter, tea rooms, &c.

EMNETE.—Norfolk County E.C. has acquired a site for an elementary school.

FELLING.—The U.D.C. has decided to offer the L.N.E.R. £1,368 for land at Pellaw for housing purposes.

GLOUCESTER.—A new £50,000 shopping centre, involving the destruction of 50 houses, is being proposed.

HALESOWEN.—The extension of the grammar school is to cost £20,000.

HALLIWELL.—Houses are being erected by Leigh Bros., Ltd., of Bark-street, at Halliwell Hall Estate and Tonge Park Estate.

HORBERY.—A faculty has been granted for a memorial screen in St. John's Parish Church, at an estimated cost of £256.

HORSFORD.—The U.D.C. propose erecting 100 more houses.

KENDAL.—Plans have been prepared for a concrete factory at Netherfield Works, Kendal, for Messrs. Somerville Bros. The architects are Messrs. Carby, Hull & Sons, Leeds.

KINGSWOOD.—The U.D.C. resolved to apply to the M.H. for sanction to borrow £8,000 for the erection of 18 houses.

LEMINGTON.—A pavilion is to be erected at the Recreation Ground at a cost of £350.

LLANOVER.—The M.H. has agreed to sanction the erection of 180 houses, in addition to the first instalment of 300 already decided upon, to be completed within two years for the Estate Co.

LONDON (FINCHLEY).—Christ's College, Finchley, is to be enlarged at a cost of £33,000.

LONDON (GREENWICH).—The B.G. are spending £15,000 on extending offices and building a new board room.

LONDON (LAMBETH).—The Charity Commissioners have offered to sell the Governors of St. Thomas's Hospital ground in Paris-street, Lambeth Palace-road, for the erection of a mothers' and babies' centre.

CHAIRS FOR ALL PURPOSES STRONG & INEXPENSIVE.

GEO. M. HAMMER & CO. LTD.
CROWN WORKS, ST. JAMES'S RD.,
BERMONDSEY, LONDON, S.E. 16

The total cost of the extension, including the ground will be about £4,500.

MACCLESFIELD.—The R.D.C. has decided to build twenty-two houses fronting on to the London-road at Lyme Green.

MANCHESTER.—The Council are proposing to erect a new open air school in Middleton-road, and the E.C. are seeking approval of a scheme to acquire two plots of land at a cost of about £4,100. The Committee are also seeking to establish a clinic in Ashton Old-road, at a cost of £1,241, and a handicraft centre in Heald-place, Rusholme, at a cost of £2,894.

NANTWICH.—The Council are inviting tenders for the erection of 46 houses on the Wallfields housing site. Plans by the Borough Surveyor.

NEWBURY.—The R.D.C. has received sanction from the M.H. to a loan of £4,000 for the Boxford housing scheme.

NEWCASTLE.—The M.H. has approved plans of 84 houses by the Corporation at Slater's Quarry, Barrack-road. The Council is also to commence upon the erection of 325 houses at Cow Gate in the near future.

NEW MILL.—The U.D.C. has approved a scheme for 24 stone-built houses at Kirkroyd's-lane, New Mill. The sanction of the M.H. is awaited.

NEWPORT (I.O.W.).—The M.H. has sanctioned a loan of £1,300 for the purchase by the Corporation of a housing site at Elm-grove.

NORFOLK.—The Standing Joint Committee have decided to obtain plans for police houses at Ashwell-thorpe and Northwood. A committee has been appointed to deal with the question of the provision of accommodation for men, defectives.

NOTTINGHAM.—Important structural alterations which may cost about £8,000, are in contemplation at the Arkwright-street Wesleyan Chapel.

OUTWELL.—Norfolk C.C. have now obtained the faculty for the alteration of the churchyard wall, so that there is now no obstacle in the way of the reconstruction of the Norfolk Bridge.

PLYMOUTH.—The C.B. recommend that application be made to the M.H. for sanction to borrow £2,340, for the erection of four houses. The C.B. passed plans for 21 houses in Watts Park-road, for Messrs. Pearse.

PONTEFRAC.—The M.H. has held an inquiry into an application by the T.C. for permission to borrow £65,000 for laying down a new 16 in. main.

PRESTWOOD.—The Staffordshire, Wolverhampton and Dudley Joint Committee have under consideration proposals for extensions at Prestwood and Himley Sanatoria.

RIPLEY.—The M.H. have approved of a further fifty houses to be erected on the Corporation's Housing site.

ROCHDALE.—An amended plan of the lay-out of the Clarke's-lane housing site, providing for 54 houses was approved by the Committee.

RUNCORN.—The E.C. are urging the County authority to provide additional accommodation at the Runcorn County Secondary School, and to erect a new school in the Halton end of the parish.

SABEN.—The St. Nicholas School are making efforts to raise funds for extensions.

SEAFIELD.—The sanction of the M.H. has been obtained to the borrowing of £20,000 for the construction of streets and sewers on the Wybourne Estate. With regard to the Overton-road scheme, the Estates Committee states that the M.H. has approved formal sanctions to the borrowing of £10,920 for houses.

SOLTHILL.—The R.D.C. are to make application to the M.H. for approval of the erection of the following houses: Baddesley Clinton (6), Elmdon (4), Lapworth (6), Solihull, Olton, and Shirley (18), and Tanworth-in-Arden (20).

SOUTHEND-ON-SEA.—The C.B. passed various plans including twelve lock-up garages, Western-road, for A. Hood; twenty-four houses and twelve garages, Brunswick-road, for Purkiss Bros.; nine houses, Ambleside-drive, for H. Goldsworthy.

SOUTHWICK.—The U.D.C. has decided to proceed with erection of 44 additional houses on its Marley Potts estate.

STOCKPORT.—The Surveyor submitted to the General Purposes Committee plans of under ground conveniences on the land in St. Petersgate, adjoining the public baths, and reported: he, to construct the conveniences entirely underground, the site was not large enough, and suggested the construction of underground conveniences in Duke-street, near the junction with Lord-street. It was resolved that the Borough Surveyor prepare plans of underground conveniences on the site suggested.

TORQUAY.—The E.C. has approved plans for the new elementary school at Westhill, with the omission of baths, to which the B.E. objected. Plans have been prepared for the conversion of the St. Mary-church C.E. school into a junior mixed school. Plans passed: Twenty-four houses, Daison estate, for T. V. Mstone & Sons; 24 houses, Daison estate, for J. Lloyd; fifteen houses, Daison estate, for W. Rowe.

TOTTINGTON.—Tenders are being invited by the U.D.C. for the alterations at the Collector's Office at the Town Hall. Plans have been prepared by the Surveyor.

TULLAMORE.—The King's C.C. have received a communication from the King's County Civic Reform Association recommending, in connection with the rebuilding of the County Courthouse, Tullamore, the provision of a large public hall.

WAKEFIELD.—Tenders are being invited for the erection of a house at the Balk, Walton. Plans have been prepared by Messrs. Bell & Kay, A.R.I.B.A., Wakefield.

WALPOLE.—Norfolk E.C. has decided to erect a permanent school in place of the temporary buildings at Walpole Cross Keys.

WARMSWORTH.—Plans have been prepared by the architect's department of the West Riding C.C. for the erection of a proposed open-air school, at an estimated cost of £19,500.

VOL. CXXIX.—No. 4,311

SEPTEMBER 18, 1925.

THE MINISTRY OF HEALTH'S REVIEW OF TOWN PLANNING

TO all who are interested in the future of our towns, the review of the subject of Town Planning, published as extracts from the Annual Report of the Ministry of Health will be of particular interest.

There can be little doubt that the subject of town planning is growing in interest to the general public, and its meaning is also beginning to be far better understood by the man in the street. Compulsory town planning for the boroughs and urban districts with a population of 20,000 and over may have something to do with this better understanding, but not by any means everything. Only about half of these authorities have so far taken the necessary steps, and the increase has been largely among those local authorities upon whom town planning is not obligatory.

So far Oxford is the only city which has availed itself of the power given by Section 21 of the Housing, &c., Act, 1923, to apply for authority to prepare a scheme to protect an already developed locality. Other authorities which, it is understood, have the question under consideration are the ancient towns of Chester and Stratford-upon-Avon, which should be preserved and protected, if they are to retain their present charm.

Local authorities have generally contented themselves with settling the main lines of development, wisely leaving reasonable scope for play and adjustment in smaller matters, and in the application of the main proposals to the actual development when it takes place.

The progress made in the submission of preliminary statements and schemes shows an improvement on the previous twelve months, but is still relatively small, possibly owing to the still too numerous formalities which have to be complied with to meet the Ministry's wishes. The importance of co-ordination between the schemes of adjoining authorities cannot be too strongly emphasized, and all who have had to deal with town planning schemes will desire to pay a tribute of appreciation both to the officials of the Ministry of Health and to the Divisional Engineers of the Ministry of Transport for their ready co-operation and assistance in the provision of new roads and the improvement of existing roads.

Much good work has already been done. Public open spaces have been secured. Low lying land has been preserved from building, new roads and bridges have been constructed in all directions, but one important omission must be drawn attention to in these columns. The most perfect of town plans and the best made of roads may be absolutely ruined by a fringe of shoddy bungalows, and this unfortunately is the state of far too many of the most important of our national highways in the vicinity of nearly all our large towns. It is not sufficient merely to lay down building lines, however generous, or to prescribe by-laws. Some control there must be over the design and material of these wayside bungalows, and the Ministry of Health would do well to look into the present series of model clauses for town planning schemes and see if a clause cannot be devised to meet this widespread cancer which threatens in some places to undo the good that has been done in other directions.

It is encouraging to note that there are now some thirty Joint Regional Town Planning Committees representing no less than 427 local authorities, established in various parts of the country, six new regions having been formed during the past year. Although these Regional Committees are at present in most cases only advisory, they are the beginning of a most fortunate and important movement in local government. Municipal councillors are beginning to look beyond their own boundaries and to consider the welfare of the whole of their region, and such widening of the municipal horizon has great possibilities for the future, especially in our industrial areas.

The Ministry of Health in their notes on special points of difficulty, point out that the main trouble experienced in connection with zoning has been to prevent areas most fitted for industrial purposes, and likely to be ultimately so used if kept long enough, from being used for the erection of houses. Human nature, being what it is, realises the possibility of a quicker sale for the more common type of development than for the more specialised form for which the land is really best suited. Shopping centres, too, are not readily established in new neighbourhoods, and all the skill of the town planner will be required to guide the shopping community into the desired channel.

It is satisfactory to note that the formal appeals to the Ministry against the decision of a local authority are fewer than in previous years. Many areas have already been extensively developed under the protection of the General Interim Development Order, 1922, while applications from local authorities for consent to departures from their by-laws as to streets in connection with interim development are becoming fairly common. Some of the subjects of appeal to the Ministry are of interest. An authority proposed to consent to the erection of a motor omnibus depot in a residential area. On appeal by neighbouring owners and residents, the Ministry, after careful consideration, disallowed the proposal; and in another case, the erection of a large garage in a shopping and business area was only permitted on condition that the garage was set back sufficiently to provide a standing place for vehicles.

Many points have arisen on the construction of roads of more than the usual by-law width, especially in the case of local authorities with small financial resources. It is not contemplated that roads so projected will necessarily be constructed by local authorities in advance of private development. It is essential, however, that when land is ripe for building the owner should be in a position to secure the construction of suitable streets for his own development, without waiting for the local Council to take the initiative and without greater cost than that of ordinary private street construction, and the Ministry point out that it is not obligatory that such roads when constructed should be made at once with the full width of paved carriageway and footways ultimately intended.

The model clauses provide for the alternative construction of the roads by the owner himself as private streets, when he wants them, subject merely to the approval of the lay-out and construction by the local authority, which, however, is not empowered to require a lay-out or specification involving greater cost than the normal cost of private street making unless the Council itself accepts responsibility for the difference. The majority of our existing highways are in need of widening to meet present day conditions, and it is essential that such widenings should be taken into account in the preparation of town-planning schemes.

Some 433 schemes, affecting 281 local authorities, have so far come before the Ministry in various stages, and it is a little disconcerting to learn that only 17 schemes (including two amending schemes) submitted by 12 local authorities, have been finally approved in the sixteen years since the first town-planning Act of 1909. This would seem to point, not to any lack of sympathy or understanding on the part of the Ministry or the local authorities, but to the cumbrous delays of the existing procedure, and the series of formalities extending in most cases over many years, which are apt seriously to imperil the ideals and dissipate the driving force of the most enlightened. The Ministry must sooner or later delegate many of its present powers, and the leading strings under which local authorities still continue to be kept must eventually be swept away.

NOTES.

Building Costs.

APPARENTLY the speculation which was characteristic of the unsettled state of the world a few years ago, and which caused prices to soar and fluctuate to such an extent that no one could buy ahead with any reasonable degree of safety, has subsided. We see a more stable level in the cost of every-day things, and according to the latest report (issued last week) of the Inter-Departmental Committee appointed by the Ministry of Health to survey the prices of building materials, there have been no violent changes in the prices of building materials during the past eighteen months. Since the beginning of last year some materials have gone up a little and others have slightly decreased in price, but these changes are such as can be attributed to ordinary market fluctuations always to be expected even under stable conditions. Building costs are still high, and one cannot look for a boom period until they are considerably reduced. It is an important asset, however, to be able to tell a prospective building owner with practical certainty that the final cost will not be altogether out of proportion with the original estimate owing to fluctuations in prices while the building is going up, and this alone should influence many who are withholding building operations until such time as they can know exactly what their commitments will be.

Steel Houses.

By a resolution of the Trades Union Congress, the building trade unions have now secured the support of that body in their opposition to steel houses. Nothing is said in the resolution against steel houses as such; the complaint is solely against "Lord Weir's attack on the rates of wages and working conditions in the building industry in

attempting to secure the erection of steel houses by non-building labour." Apparently, the work of the Government-appointed committee which considered this question in all its bearings, and reported in favour of steel houses being erected by other than the recognised building trade labour, is so much wasted time and effort, and a further attempt is to be made to prevent the erection of steel houses. No one wishes to see houses of steel if they can be built in sufficient numbers of materials to which we are accustomed. But houses are so badly wanted that we do not think the building operatives will get much public support in their contention. While there is a strong public dislike of the idea of the metal house, there is a still stronger objection to having no house at all. We do not think there can be much sympathy with any attempt on the part of building unions to keep for themselves more work than they can possibly carry out, while ignoring the existence of unemployed in the iron and steel trades who would be glad to do it.

Ruislip Church from the South-East.

Ruislip Church from the North-East. (See p. 420.)

House Design.

"WHEN you see the wretched little villas they are putting up, with their narrow little windows, their imitation pillars and pompous little lych-gates, you begin to realise that we are finding little improvement on the old Victorian atrocities," said a speaker at a gathering held in London last week. These remarks were widely reported and described by the Press as a "candid criticism of the modern architect's efforts," and words which we like to think were uttered in haste are doubtless construed by millions of readers to be an accurate description of the facts. Such statements are specially to be regretted at a time when an enormous improvement in small house design is to be seen all over the country as a result of the influence of the architectural profession in local authorities' housing schemes. Certainly no architect had a hand in the "wretched little villas" which aroused this speaker's ire, and it is equally certain that such villas are not being erected in large numbers. In these days of high costs, and when the operation of the Rent Restriction Act makes it cheaper to rent houses than to buy them, we find that the speculative builder who does not take professional advice has taken a leaf from the architect's note-book and is saving money by dispensing with the pillars and lych-gates which an improved public taste does not ask for. Surely it is unfair to blame architects for matters over which they have no more control than the author of the "candid criticism."

The Mansard Gallery.

THE very pleasant little exhibition in the Mansard Gallery, Tottenham Court Road, shows what some very energetic effort has been able to do together representative of artistic craftsmanship in the New Forest district. We feel some regret that nothing more than this can be obtained, we may at least hope that some encouragement may be given towards the development

Black Marble Font in Ruislip Church (Circa 1200).

Whatever talent may be found. The given materials from the Forest looms, perhaps, the best of the craftsman-ship shown, because of their textures and excellent colourings. There is much to be displayed in the setting and arrangement of the exhibits, which have every advantage that accrues from pleasant lighting in the gallery and their distinctive setting. It is a pity that the wooden candlesticks were not produced in better shapes, which might easily have been obtained. The illustrations of recent New Forest Roman pottery show that excellences the old pottery attained. They were used to be very good domestic pottery made at Symington some years ago, and we might have hoped it would have survived to the present time. Mr. Well Armfield shows some telling examples of colour decoration. Half-hour conferences are to take place in the series nearly every day up to October on various subjects connected with the development of local talent, with lectures by Mr. Harry Batsford on Art, Games, Crafts and Education by Mr. Percy Peach, School Art Library by Mrs. R. O. W. Gleadowe and Sidney Unslade, Architecture for Children by C. H. B. Quennell, and others.

Housing Bill. THERE is a suggestion that the present subsidy offered under the Wheatley Act should be capitalised and given to those responsible for certain novel methods, to build houses that could eventually be sold either to a local authority or to individual purchasers. A proposal would mean a cash sum of £160, available for each house erected in an industrial area, and of £222 in rural parishes. Thus a house costing in all £380 might be sold in a district for £158. It is proposed that the local authorities should not be required to find a subsidy out of the rate. Those who approve the proposal in

principle have urged on Mr. Chamberlain that such a scheme would encourage those developing new methods to erect factories and to install machinery, so that, given large orders, they could quote low prices. In such circumstances it is thought that local authorities would be prepared to place orders, especially as no burden is placed upon the rate-payers. Although the Ministry of Health has agreed that no doubt private buyers would be glad to take advantage of such a scheme, the officials are by no means assured that contractors would build the necessary factories or quote reasonable prices. Inquiries are, therefore, now taking place in order to see whether the scheme is worth pursuing, especially as, if adopted, it imposes an immediate additional demand on the Exchequer.

The Manchester Cenotaph.

It will have been noticed that the area in front of the new Art Gallery Buildings in Manchester was designed to have some outstanding monument or memorial. On the face of it one would be inclined to sympathise with the suggestion which has been put forward that the Cenotaph by Sir Edwin Lutyens, which has been erected in St. Peter's Square, should be removed and placed in this distinguished and honourable position. Alderman Todd says that according to the plans of the Art Gallery Buildings there would be

no room for the Cenotaph, as the lay-out of the design included "various statues and a clock tower." Whether "various statues and a clock tower" could have an equivalent value to the Cenotaph we may well feel doubtful. Perhaps Manchester may decide that the finest site they have in the city is not too good to do honour to its heroic dead.

Amongst the numberless The Willett Memorials constantly being placed all over the country, it is doubtful whether we

can be satisfied that the best memorial one can offer to the memory of notable folk is not something which shall be of lasting benefit to the public. We are, therefore, glad that the memory of the late Wm. Willett should be perpetuated by the dedication to public use of the beautiful Petts Wood, Chislehurst. We can recall talks we had with Mr. Willett in his well-founded hopes of a success which he did not live to see, and we remember his account of the visit paid by a lady to a lady X in the country which, unknowing by her had been enjoyed in the new anti-dated summer time, much to her chagrin when she found out that she, a determined opponent of the change, had been so completely deceived. Many of us realise in the enjoyment of added hours of daylight that we owe much to the sustained effort of reformers for an increase in our comfort and pleasure.

Fresco in Rood Turret, Ruislip Church.

[Above, St. Michael weighing souls, the Virgin Mary lightening scale with finger. Below, St. Lawrence.]

GENERAL NEWS

Birmingham Housing.

The Town Council have entered into contracts for something like 10,000 houses.

Trafalgar Square.

Several well-known architects are advocating fixing Gilbert's fountain, recently removed from Piccadilly-circus, in Trafalgar-square, in place of the two there at present.

Leverhulme Sale.

The late Viscount Leverhulme's art collection is to be dispersed, and the sale will be begun at The Hill, Hampstead Heath, on October 12.

Bridlington Spa Reconstruction.

The Town Council have passed the amended scheme for the reconstruction of the Spa. The scheme is estimated to cost £50,000, and has been prepared by Mr. A. P. Horsley, Borough Surveyor.

Big Birkenhead Scheme.

It was announced by the Liverpool City Council recently that Messrs. Cammell, Laird's are to extend and remodel their shipbuilding yards on the Birkenhead side of the Mersey, at a cost of £150,000.

Norwich Castle Moat.

A proposal to erect a new block of administration offices for the Norfolk County Council in the moat of the Norman castle at Norwich has aroused considerable opposition on the part of local archaeological societies.

New Kensington Museum.

The new Science Museum in Exhibition-road is to be completed after a long delay due to the war. The building has been designed by Mr. R. J. Allison, F.R.I.B.A., chief architect to the Office of Works.

Proposed Niagara Bridge.

The proposal for the construction of a bridge across the Niagara River, between Fort Erie and Buffalo, has been approved by the International Joint Commission. There is to be 100 ft. headroom under the bridge.

Reconstructing Paddington.

The Great Western Railway Company have decided to undertake the reconstruction of their Paddington goods station and the installation of up-to-date equipment, including electrically-operated labour-saving appliances.

The "Comparative" History.

Sir Banister Fletcher's "History of Architecture on the Comparative Method," which is now in its seventh edition, is being translated into the Spanish language. It has already been translated into Russian.

Excavations at York.

Systematic excavations were commenced recently on the ramparts of the mediæval city wall at York with a view to opening out the foundations of the multi-angular tower of the Roman fortress which lies buried below the rampart.

Stocksbridge Proposed Baths.

In connection with the proposed public swimming baths, the estimated cost of which is £12,000, the Council has asked Mr. G. Wishart, of Swansea, the architect whose design won the first prize in the competition, to prepare a less elaborate scheme.

Ancient Roman Statue.

During restoration work at the Thermae of Septimius Severus a marble statue of Minerva was recently discovered. The statue, which is headless, is in a good state of preservation, and is believed to be the work of a sculptor of the third century.

Manchester Town Planning.

Manchester's progress in town planning will be inspected on September 23, when a deputation of members of the Garden City and Town Planning Association are to visit the city. They will be guests of the City Council through the Housing and Town Planning Committee.

Tate Gallery Extensions.

Rapid progress is being made with the new extension at the back of the Tate Gallery, and it is expected that it will be finished in the late autumn. It will not be opened, however, until next June, as the walls must dry thoroughly before any pictures can be hung.

Annesley Bridge.

A start has been made with the work of constructing a new bridge to replace the present Annesley Bridge at Fairview, Ireland. The work, which is to cost £12,542, will extend over a period of ten months. The new bridge will consist of concrete piers and superstructural steel work, and will be 80 ft. wide.

Poole Harbour.

Work commenced recently on the construction of a "training bank" at the mouth of Poole Harbour, which forms the principal part of a £3,250,000 scheme to increase the depth of water in the harbour channels in order to admit vessels of 5,000 tons and upward. Sir John Wolfe Barry & Partners are the engineers.

Blackfriars Priory.

The excavations now taking place on a site in Carter-lane, at the corner of Church Entry, have brought to light remains of the ancient monastery or Priory Church of the Blackfriars. From an old plan of the monastery, the remains appear to be a portion of the foundations or walls of the choir; they consist of stones, four of which are segments, of the pedestal of a pillar.

A Super-Skyscraper.

In gratitude for his son's recovery from a serious illness, Mr. Oscar Konkle, President of a wealthy real estate company, announces that he will construct in New York the tallest building in the world, containing sixty-five storeys and towering 800 ft. above the street—8 ft. higher than the Woolworth Building—for the purpose of a modern hotel containing 4,500 rooms. The premises will provide for an inter-denominational church, a hospital, and twelve roof gardens, a bank for missionaries, and a dining-room seating 2,000 persons.

Dunbar Castle.

The First Commissioner of His Majesty's Board of Works has communicated with the Town Council stating it would be a pity if the high isolated mass of Dunbar Castle were demolished.

The late Mr. David B. Dick.

Mr. David B. Dick died recently at Hornsell Rise, aged eighty. Trained as an architect in Edinburgh, he went to Chicago after the great fire to help to rebuild it. Afterwards he went to Toronto, Canada, and settled there, Toronto University being among his many achievements. He was elected an Academician of the Royal Canadian Academy, and was a member of the Ontario Association of Architects, and later of the Canadian Institute of Architects.

The Late Mr. E. T. Jago.

The death occurred in New York, on September 4, of Mr. Ernest Thomas Jago, A.R.I.B.A., at the age of 53. Mr. Jago served his articles with J. F. Bentley during the time that Westminster Cathedral was being built, and afterwards spent several years in the office of Mr. J. N. Comper. He practised in the Adelphi for some time, but in 1914 he went to Canada, passing thence into the office of Mr. Bertram G. Goodhue, where he soon became a leader, and on Mr. Goodhue's death in June last year, joined with the other three heads in carrying on the practice. His body lay in the chancel of St. Thomas's Church, New York, till the day of his burial, which took place at Staten Island.

CORRESPONDENCE

[While we are glad to publish letters on professional and other matters of interest to our readers, it must be understood that we do not necessarily endorse the remarks of correspondents, who will oblige us if they will express their views as briefly as possible.]

Figures in Architectural Perspectives.

SIR,—I venture to call attention to an anomaly not infrequently observable in architectural perspective drawings, viz., that the artist, while meticulously observing the scale proportions, and vanishing lines of all parts of the building represented, introduces figures and objects apparently in total disregard of those points. As an instance, witness the figures in the foreground of the drawing reproduced on page 390 in *The Builder* of 11th inst. In that case the heads of all figures on the picture-plane—no matter in what part of it—should, of course, appear approximately at the level of the perspective horizontal line, slightly above rather than below, unless representing very diminutive persons.

WM. H. ATKIN-BERNARD.

Leeds Improvement Scheme.

Correspondence on the proposed Leeds Improvement Scheme is given on p. 428.

COMPETITION NEWS

Burnley Proposed New Buildings.

The Burnley Town Council are considering the question of having an open architectural competition for new buildings in the market street (St. James-street).

Pontardulais War Memorial.

The design submitted in this competition by Mr. D. Morgan, architect and surveyor, Glasfryn-road, Pontardulais, has been accepted. Seventy designs were received.

Competitions Open.

	Particulars published in "Builder."	See
Drammen Bridge (Drammen, Norway). Premiums: 10,000 Norwegian crms., 8,000, 6,000. Apply Gov. Eng., Drammen.	May 29 ..	O
Newcastle Fire and Police Station. Premiums: £500, £300, £100. Mr. P. S. Worthington, F.R.I.B.A., Assessor.	June 12 ..	O
Town Hall, &c., Pretoria. Open to architects residing in South Africa or Registered under Architects' Act, of 1909, Transvaal. Assessor to be appointed by R.I.B.A. Premiums: £250, £150, £100.	— ..	N

BURNE-JONES TAPESTRIES AND FIGURE OF "ORPHEUS" BY MR. JOHN M. SWAN. R.A.

ONE OF THE GALLERIES OF MODERN BRITISH ART.

The Palace of Arts, British Empire Exhibition, Wembley.

SIR JOHN W. SIMPSON, P.P.R.I.B.A., & MR. MAXWELL AYTON, F.R.I.B.A., Architects.

ST. MARTIN'S CHURCH, RUISLIP

By F. HERBERT MANSFORD, L.R.I.B.A.

AT the Norman conquest "Riselepe" was a small settlement in the forest of Middlesex, which stretched right across the northern portion of the county from the Colne to the Lea. As Domesday Book refers to a priest attached to the parish in the reign of Edward the Confessor, it is clear that a Saxon church once existed. There being no building stone near Ruislip, nor any Roman remains to be used as a quarry, this church must have been built of timber and plastered wattle, or of timber logs like that at Greenstead, Essex. The walls of the present church are built of flint, doubtless from the chalk quarries near Harefield, and are about three feet in thickness. The general aspect externally is that of the fifteenth century, due to the details of buttresses, windows, parapet and roofs. Internally, greater antiquity is apparent. The Purbeck marble font is of transitional design, perhaps as late as the year 1200. Rev. J. Chas. Cox, F.S.A. in his "Account of the Ancient Churches of Middlesex," wrote "The arcades of the nave are of the date of Edward I at the close of the thirteenth century." But he seems to have overlooked several points enumerated later. These not only show that the two arcades can hardly have been contemporaneous, but indicate that in the south aisle, and there only, we have the walls of part, or the whole, of the thirteenth-century church.

The threshold of a built-up south door is now about two feet below the level of the ground. The threshold of the north door is level with the churchyard.

The arcade dividing the south aisle from the nave is very similar in character to that at Harrow Church, which is documentarily dated as being erected about 1240. We may assume that this arcade, too, dates from about the middle of the thirteenth century. Now the work to the north and south of this arcade must either have been contemporaneous or one portion must have been of earlier date than the other. There are no features in the nave to suggest that it could have been built before the middle of the thirteenth century. If we accept the idea of contemporaneous building, then we have to assume that the few monks who were then installed at Ruislip undertook a very great work indeed. That would be to build in addition to the dormitory, refectory, &c., a complete church with capacious nave and

aisle and the necessary chancel all at one time; a great undertaking for a community of 12 monks with only a small population to assist them and no materials for the walls conveniently at hand. Although the present flat roof of the aisle cannot, from its character, be later in date than the year 1500, it is obviously not the original roof. Internally it cuts right across the tower arch, and externally, upon the east face of the tower, a raking course of masonry can be clearly seen which protected the flashings at the line of junction with a steep pitched gable roof. A roof which required replacement before the year 1500, probably dated from two or three centuries earlier. The four south windows of the aisle are replacements of earlier and smaller windows. They are not centred opposite the arches of the arcade as they would naturally have been if contemporaneous. That these windows were inserted before the present roof was erected is apparent from the awkward way in which the corbels of the roof impinge upon the window arches.

Most of the piers of the arcade lean northwards, which could be explained if the arches were cut in an existing external wall which had been pushed outwards by roof thrust from the south.

The aisles of thirteenth-century village churches were usually narrow with lean-to roofs. It is clear that the original roof was double-pitched, and of the present width.

A stone corbel which projects aimlessly above the capital of the most easterly pier may have supported the original roof. But it may also have carried one end of the rood beam before that was moved eastward in line with the later existing chancel arch.

The lack of relation between the position of the buttresses and the portions of the door and windows points to the conclusion that these were added in the fourteenth or fifteenth century to a previously existing wall.

The built-up door affords little clue. The mouldings have completely weathered away, but the form of the arch suggests the thirteenth century. It is not unlikely that the entrance to the Norman church was at the west, and that it was destroyed when the tower was built.

These considerations suggest that the south aisle is not only the oldest part of the existing structure, but that the walls enclose

part, and perhaps the whole, of the Norman church.

The nave consists of six bays and measures approximately 63 ft. by 22 ft. internally. The only direct light which it receives is from the west window. There were once three dormer windows on the south side of the roof, as can be seen from an old print in the Vestry. Similar dormer windows still exist in neighbouring churches, e.g., Ickenham, Pinner and Hillingdon. The pointed arches are of two orders, both chamfered on the north arcade, but only the inner order on the south. The arches are enclosed with a label moulding on the side towards the nave only. It will be noticed from the plan that the piers of the two arcades are not opposite each other, but are irregularly placed and spaced. Those on the south have the hollow water-holding mould at the bases which is characteristic of the thirteenth century. The southern piers are built of small square blocks of stone usual when stones had to be carried from a distance on backs of mules and pack horses. The northern piers are of larger blocks, and the capitals a coarse imitation of those on the south. The details show that the north arcade is of later date than the south, and that is what the appearance of the north aisle would suggest as it is obviously of late Gothic design. It may be that the present aisle succeeded an earlier narrower one, but what evidences exist point the other way. If anyone stands near the pulpit and looks along the line of capitals westward, he will be struck with the awkward way in which the arches rest upon the capitals. Some arches rise from the edge of the abacus on one side, and leave a shelf of about 6 in. to the other. It seems as if the north wall of the nave must have been thrust outwards by roof pressure before the columns were erected, so that the capitals had to pick up their load where they could, as otherwise they themselves have had to be built out of the wall. The structure of the church confirms what would expect, namely, that it was enlarged gradually as the population increased.

The oak roof of the nave is a seven-trussed rafter roof with tie beams at intervals. The beam at the east end has been cut away to afford a better view of the formerly existing paintings over the chancel arch. The under of the rafter is ceiled with oak boarding to shut out the draught. This boarding is divided into intersecting ribs into rectangular panels of varied sizes. At the intersections are capitals, about two-thirds of which are ant-

Plan of Ruislip Church.

The Interior of Ruislip Church.

the carving of these can hardly be placed as early as the roof itself, and it is likely that the roof was originally an open one and that the ceiling boards were affixed in the fifteenth century. The eastern bay is not divided into compartments, and this difference is not without significance. Before the restoration in 1869-70 the eastern bay had a lath and plaster ceiling. Probably this was once painted to represent the sky above the Rood.

It seems fairly certain that the monks built the new nave about the middle of the thirteenth century, and that nave necessitated a chancel. It is not possible to identify any feature of the present chancel which could be earlier than the year 1400. It is probable that the chancel which the monks built was lengthened and heightened subsequently, apparently about a century later. There are two evidences of the earlier chancel. There are raking lines in the masonry above the chancel arch on its eastern side forming a slight "set off" below the present arch, and externally there is a small window, perhaps ventilation opening, which can be seen very high up in the gable forming the east end of the nave. But the cill of this opening is now below the ridge of the chancel roof. This is one of the braced collar type common in the thirteenth and fifteenth centuries, and the oak is beautifully grey in tone. There is no ridge piece, the heads of the stout rafters being lashed together and fastened with oak pins. The windows are all of Perpendicular character, with super mullions in the tracery and depressed arc-centred arches. The eastern window on the north side has its cill at a higher level than the others to afford headroom for a small door which led into a sacristy. The door remains with its ancient ironwork and fastenings, but is built-up externally, and the sacristy was demolished at some time unknown. The foundations have been recently uncovered by the writer, and remains of the lead flashing of the roof can be traced under the cill of the previously mentioned window. The fact that the buttresses at the east end of the chancel are placed diagonally and not in pairs at right-angles suggests that the east wall at least is earlier than 1400.

The tower cannot be definitely ascribed to any particular century. The belfry stage and battlemented parapet may be additions to an

earlier and lower structure. The stairs are a later insertion, being contained in a rather flimsily built turret which impinges both on to the north tower arch and the jamb of the west window of the nave and breaks quaintly through the nave roof. Probably the original ascent was made by short flights of elm logs roughly squared and built against the interior of the walls, as can still be seen at Hayes Church (Middlesex). There is a horizontal string course of stone built into the north wall of the tower above the gutter of the nave roof. The object of this must have been to protect the lead flashing of the gutter. This proves that the tower was built either at the same time as the nave or subsequently, and not before, when no gutter would have existed to need protection. Now, if the tower and nave were built together it would have been natural to have extended the nave as far westward as the tower, and made the north-west buttress of the tower part of the west wall of the nave. No more walling would have been necessary, and the nave would have been 5 ft. longer. We may conclude that the nave was built before the tower and that the cost was such that no further outlay was contemplated for a generation or two. Probably the bell or bells hung in a turret on the roof of the nave as at the neighbouring churches of Ickenham, Northolt and Cowley to this day. The way in which the east tower arch is cut by the present roof of the aisle, and the outline of the former roof visible on the outside of the north wall of the tower, prove that the tower cannot be later in date than, say, 1500, which is about the latest date for the present aisle roof. But towers of that date were nearly always erected with staircases and their buttresses were usually diagonal on plan. For this reason it seems more likely that the tower was erected at the beginning rather than the end of the fifteenth century; that was a time when peals of bells became common in parish churches. The lower part of the walls internally is built in a rough chequer work of squared stones and squares of cut flints. Externally no masonry is visible between the plinth and the string course beneath the belfry windows. Probably this was not always so. Stone lacing courses or blocks may have existed and decayed, and not been replaced when the flint facing was renewed, as it appears to have been. It should

be noted that the axes of the tower and aisle are not identical.

In the reign of Henry IV Ruislip ceased to be a priory. For two centuries it had been attached to the Abbey of Bec in Normandy. The lands at Ruislip were granted by the King to his son John, Duke of Bedford, who was Regent of the English possessions in France in the time of Joan of Arc. The further enlargement of the church by the erection of the north aisle, about half a century later, must be attributed to the needs of a growing population. This aisle fortunately remains as first built, and presents an unusually symmetrical and balanced elevation to the north. The equally spaced buttresses divide the length into six bays. The most westerly presents an unbroken wall, but four of the others are occupied by wide low windows identical in their tracery and with depressed arches springing from pier to pier, so that the only solid curtain walling is below and above the windows, thus giving the greatest possible area for stained glass. The centre bay contains a typical Perpendicular door with traceried spandrels inclosed within a label moulding. It is rather surprising that a north door should have remained so long in use unpierced. The roof is very low pitched and quite hidden by the battlemented parapet. The rood stair turret at the east end of this aisle belongs in date to the chancel and not to the later aisle. The bonding of the masonry with the wall of the former and the absence of proper bond with the aisle is evidence of this. Before the aisle was built there may have been a shallow transept affording approach to the turret internally, but there is no trace of this. As there are still two or three churches where the approach to the rood stair is only from the outside of the church, it is possible that here was another instance. The stairs of the turret ascend considerably beyond the level of the old rood beam and must have once led also to the roof, but the turret is now capped level with the top of the low parapet, and the opening on to the rood loft has been bricked-up.

No further addition to the fabric took place until a porch was built at the west end, about thirty years since. But various fittings have been altered, removed, or provided, to meet the changing fashions of worship since the Reformation. James I having ordered a sermon to be

preached in every parish church every Sunday. "a neat and comely pulpit" had to be provided. It is of the usual Jacobean type, of oak, hexagonal, with clumsy applied enrichments of lozenges, &c. The canopy and back board have disappeared and the pulpit lowered in height. An oak table inlaid with walnut served as the Communion table for about two centuries; it is now in the vestry. A finely carved case containing shelves for alms bread, is in the tower; it must be by Grinling Gibbons, or some pupil. Of mediæval furniture, there are two fine large chests of elm, about 500 years old, and several pre-Reformation pews.

A west gallery was erected for the "Psalm singers" in 1754, and remained until 1869, when the wave of "Restoration" reached Ruislip. The nave was restored by Sir Gilbert Scott and the chancel by Ewan Christian. The floor of the former was raised six inches, thus obliterating the chancel step and nearly submerging the bases of the piers. The plaster ceiling of the east bay was removed, also the three dormers. Roof timbers were renewed where necessary. The hatchments, which occupied the spandrels over the piers, were relegated to the tower. The gallery having been abolished, the organ (enlarged) was re-erected at the east end of the south aisle, where it blocks two stained windows and hinders the formation of a side chapel. The removal of the vicar's and the squire's pews from the chancel brought to view some ancient encaustic tiles, the fourteenth-century grave of Roger de Suthcote, and the fine series of Hawtrey slabs with their sculptured heraldry.

In 1857 some ancient wall paintings had been discovered, so that Scott gave instructions for the walls to be cleaned with care. Tracings of painting can be seen on both walls of the nave, on the north and east walls of the chancel, and at the east end of the north aisle. This last represents St. Michael weighing souls and the Virgin Mary deflecting the balance with her finger. Below is St. Laurence carrying his grid-iron.

EXEMPTED STUDENTS' DESIGNS

The designs by students exempted from the R.I.B.A. Final Examination (with the exception of the subject of professional practice) are on exhibition until Saturday, September 26, from 10 a.m. to 5 p.m. daily, in the Galleries of the R.I.B.A., 9, Conduit-street, W.1. The R.I.B.A. Board of Architectural Education Silver Medal for recognised schools is awarded for the best set of designs submitted in the exhibition of designs of students exempted from the R.I.B.A. Final Examination. This year the following schools, which have courses of five or more years' duration recognised by the Royal Institute for the purpose of exemption from the Final Examination, have sent exhibits:—

The Architectural Association, London; the London University School of Architecture, University College; Robert Gordon's Colleges, Aberdeen; Glasgow School of Architecture, Glasgow; School of Architecture, University of Liverpool; Department of Architecture, McGill University, Montreal, Canada.

The following schools of architecture recognised by the R.I.B.A. for the purpose of exemption from the Intermediate Examination have sent exhibits:—

The Architectural Association, London; London University School of Architecture, University College; Robert Gordon's Colleges, Aberdeen; Birmingham School of Architecture, Birmingham; Cambridge University School of Architecture, Cambridge; The Technical College, Cardiff; Edinburgh College of Art, Edinburgh; Glasgow School of Architecture, Glasgow; Leeds School of Art, Leeds; School of Architecture, University of Liverpool; School of Architecture, The Victoria University, Manchester; Department of Architecture, Surveying and Building, The Northern Polytechnic, London; Department of Architecture, McGill University, Montreal, Canada; Bombay School of Art, Bombay.

Birmingham University Extension.

The drawing in this issue shows the new extension of the Birmingham University buildings at Edgbaston. The view is from University-road, and the extension links the library with the chemistry laboratory. On the ground floor of the new buildings accommodation will be provided for the study of brewing and fermentation; on the first floor there will be departments for zoology and bio-chemistry; and the second floor will be given up to botany. In the higher part of the building, near the tower, will be situated a lecture theatre, which will afford accommodation for an audience of 200, and will be common to all departments. The extension is estimated to cost between £90,000 and £100,000. Sir Aston Webb & Son are the architects.

New Premises

for Messrs. Bourne & Hollingsworth.

These new premises, to occupy the site of the old buildings recently demolished, are now in course of erection in Oxford-street from the designs of Messrs. Slater & Moberly, A. & F.R.I.B.A.

Organ Case, St. Peter's Church, Medmenham, Bucks.

This case is of oak, carried out to the designs of Mr. A. G. R. Mackenzie, F.R.I.B.A., by Messrs. Elliott, of Reading. The organ is by Messrs. Norman & Beard, of London. The transept arch shown in the small photo is an old mediæval arch, found and restored when the new transept was built for the organ.

Holy Trinity Church Hall, Hounslow.

This design was placed first in a competition held at the end of 1923. The scheme consists, on the first floor, of a large hall to seat 450, a stage and retiring rooms. On the ground floor is a smaller hall 40 ft. by 28 ft., lavatory accommodation, kitchen and four classrooms. The class-rooms are so arranged that they can be used temporarily for cloak-rooms in connection with both halls. The colour scheme of the large hall is cream, generally with a dado of blue, black and orange. The frame enclosing the proscenium opening is black and gold, the curtain being of a mole-coloured velvet with blue trimmings. Mr. William Lacey, of Hounslow, was the general contractor, and the following are some of the sub-contractors: Wood block floor, Hollis Bros. & Co., Ltd., Hull; service lift, James Ritchie & Sons, Battersea; electrical work, J. Webb, Hammersmith; sculpture, Mrs. Phoebe Stabler, Hammersmith; stage curtains and scenery, J. H. Edgcombe, Ltd., London; electrical fittings, General Electric Co., Ltd.; footlights, Thomas J. Digby, London; heating, Broadhurst, Craig & Ching, London; ironmongery, Alfred Brown & Co., Birmingham; sanitary fittings, Tylors, Ltd., London; structural steelwork, Redpath, Brown & Co., Ltd., London; flats, Val de Travers Co., Ltd., London; fire appliances, J. H. Heathman, London;

roofing tiles, Roberts, Adlard & Co., London. The contract price was £6,495. Mr. Cyril Farey, A.R.I.B.A., is the architect.

Eleventh Church of Christ Scientist, London.

This church is now being built in Northfleet, near the Marble Arch. The site is an open one, bounded on three sides by roads. The planning and form of the church are simple and direct, and the elevations are an outcome of the plan. The church itself, which is to hold from 800 to 900 people, all seated the floor (there are no galleries) is on the ground floor of the building, and is approached by four staircases. Beneath it, on the ground floor, is a large entrance hall and the school room, and in the basement are the lavatories and cloak-rooms, boiler rooms, etc. The building is of multi-coloured brick and the dressings of Portland stone. The roof is covered with Italian tiles. The following firms are engaged on the construction, or on the supply of materials:—General contractors, Dove Brothers Ltd., Islington, N.1; bricks supplied by Dorking Brick Co., Holmwood, Dorking; structural steelwork, Aston Construction Co., Ltd., Hoxton, N.1; steel windows, William Gamon & Co. (Kaleyards), Ltd., Chesham, Bucks; heating and ventilating, Benham & Sons, Ltd., London; electric lighting, etc., Rashleigh & Phipps & Co., London; lift, The Express Lift Co., Ltd., Westminster; wrought-iron work, Garton & Thorne, Ltd., London; sanitary fittings, Mellowes & Co., Ltd. Dr. O. Faber, O.B.E., is the consulting engineer, Mr. Hope Bagenal, A.R.I.B.A., has been acting in an advisory capacity as to acoustics. Mr. Oswald P. Milne, F.R.I.B.A., is the architect.

Proposed Church of St. John the Divine, Earlsfield.

This drawing illustrates a design prepared a few years ago for a proposed new church at Earlsfield. The detail was kept as simple as possible, both externally and internally. The walls were to be in concrete, faced with yellow stocks and finished inside with smooth faced plaster. The main roofs were to be covered with Spanish tiles and the flat roofs, vestries, etc., asphalted. Stonework was reduced to the minimum. The completed design was designed to seat 600 people. The preliminary is by Mr. A. D. Reid and Mr. A. H. Mr. Allan D. Reid is the architect.

Church of the Royal Marine Artillery, Eastney Barracks.

The seating accommodation of this church is 1,000, the cost of execution being £11,000. The tower was omitted for reasons of economy but is shown as designed. The foundations were put in by Admiralty departmental staff. The contract for the superstructure was carried out by Messrs. Corke, of Southampton. Heating and ventilation were by Messrs. of London, and wood block flooring by Acme Flooring and Pavement Company, and mosaic by Messrs. Maw; marble pulpit font by Messrs. Jenkins; and furniture seating by the Bennett Furnishing Co. The stone is Portland outside and Bath inside.

Norwich Shirehouse Extension Competition.

We illustrated the winning design in our issue for August 2. That placed second in our issue for September. This week we publish the third prize design, by Messrs. Kieffer & Fleming. The whole of the accommodation asked for has been provided, with a certain amount of extra area on the upper floors. The wall will be built of Fletton or other approved facing externally with 2-in. Tudor brick. The roof to be covered with green slates. The windows and openings, string courses, etc., would all be Ancaster, Weldon, or approved stone, the windows to be iron set in the stonework. The floors would be concrete, finished with pitch pine block flooring in offices, and with marble in vestibules, halls, and corridors. The estimated cost is £46,640.

PROPOSED LEEDS IMPROVEMENT SCHEME

WE have received the following correspondence for publication:—

SIR,—I am directed by my Council to forward the enclosed copy of correspondence, from which you are at liberty to quote as you please, should you think the matter of more than local significance. We are not desirous of publicity at the present stage, but in view of statements already made in the local press, we think it better that the principle behind our action should be known.

Our attitude is a practical attempt to drive home locally the policy advocated by Barrie, of youth challenging their betters. It is also a protest at the mere lip service rendered to youth who, on returning from France, find even the war memorials are entrusted to their elders of round about seventy. The second plea involved is that of a chance for the development of local culture and its consequent architectural manifestation, as at Liverpool. The provinces call at least for the same competitive chance against London in art as in cricket.

We claim that experience in the past does not warrant a commission of this importance being given outright to a London man, as the average of the buildings in Leeds designed by provincial architects of yesterday is higher than those designed by the London architects of yesterday. As typical fair comparison, we may name the following: The Leeds University Buildings, by A. Waterhouse, R.A., compared with the Leeds Medical School, by a local architect (Mr. W. H. Thorp, now retired); Lloyds' Bank, by A. Waterhouse, R.A., compared with the Yorkshire Penny Bank, by local architects (the late Perkin & Bulmer). The Town Hall, Corn Exchange, and Brodric's other works in Leeds, stand out as instances of local architectural culture far superior to any from London or elsewhere.

F. L. CHARLTON,
Hon. Sec. Leeds and West
Yorkshire Architectural Society.

[COPIES.]
62, Woodhouse-lane, Leeds,
August 17, 1925.

DEAR JONES,—For a long time we, as architects, have known, together with the public,

that the Corporation had in mind a vast undertaking in connection with the formation of a new street from Victoria-square to St. Peter's-street, an undertaking likely to involve the ratepayers in a very large expenditure, and I think I am right in saying that we, as the Leeds and West Yorkshire Architectural Society, numbering a good many highly competent architects of standing, together with a considerable sprinkling of clever men of the younger if less generally known school of thought, have daily expected to be approached in an advisory capacity by the Improvements Committee of the Corporation.

More recently, in common with the general public, we have heard that the Corporation had obtained certain (very extensive) powers in connection with the proposed street, and had definitely engaged the services of an architect—Sir Reginald Blomfield—to carry out the whole of the work (as to design and working drawings) on the north side of the new street. I also noticed in the press that the services of this architect had been secured by the Corporation on the recommendation of our Society. You, together with the Society as a whole, are well aware that this statement is totally incorrect. If I remember right, some years ago, Sir Reginald Blomfield's name was one of several submitted by our Society at the request of the Improvements Committee as suitable to advise them in connection with a building about to be erected on an important site in City-square, the designs for the façade of which (not by a Leeds architect), they felt were not in keeping with their ideals or the surroundings. Sir Reginald Blomfield was selected by the Improvements Committee, and, as far as I know, his advice was useful to them, and of value in preserving the amenities of City-square.

Without going into detail, it will be obvious that a man considered suitable by our Society to advise the Corporation on the façade of one building, is not necessarily the man we should consider best fitted to undertake the design of nearly half-a-mile of what I suppose will be one of the most important provincial works ever undertaken by either a public or private body.

However, in this connection, is the method of "thinking of a name" the right one at all?

I imagine not. Obviously there is only one way of getting the very best in a case of this sort and that is by competition. Naturally, I am rather strongly of the opinion that Leeds would do well to go to Leeds people, and there are clever architects in Leeds. Why not a competition limited in the first case to architects practising in Leeds, and assessed by a jury of eminent men? If no thoroughly satisfying result was obtained in this manner, then a second competition, open to the architects of the world. Surely the contemplated works are of sufficient importance to warrant such a course?

You ask my opinion on the situation, and the following points occur to me:—

(1) To be of any real service to the ratepayers the Corporation, or Sir Reginald Blomfield, the Society should have been consulted in the initial stages of the proposed street improvement.

(2) We have no inside information as to the real intentions of the Improvements Committee, but from what we have read, and heard in common talk, we are, to put it mildly, far from certain that they are acting in the best interests of the ratepayers of the city.

(3) Being asked to come in at this, the eleventh hour, when we can obviously be of no honest service, makes me think it possible that we are desired to pledge ourselves to a course which we may later regret.

Under these circumstances I propose to move the following resolution at the next meeting of our Council:—

"Leeds Street Improvement, Victoria-square to St. Peter's-street.

"This Society, while appreciating the courtesy of the City of Leeds Improvements Committee in asking that a deputation should wait on them in the Council Chamber, at the Leeds Town Hall, at 3.30, on August 25, in connection with the proposed new street between Victoria-square and St. Peter's-street, and that this deputation should be empowered to name three architects to act in an advisory capacity with Sir Reginald Blomfield if so requested by the Improvements Committee, feel that the time has now passed when such a deputation could be of assistance to the Improvements Committee, and, having been informed of the duties, responsibilities or qualifications required of the advisory architects, do not feel competent to submit suitable names. Under these circumstances

The Palace of Arts, Wembley: View in Gallery of Applied Arts. (See also p. 419.)

ces this Society does not feel justified in
ing the time of the Improvements Com-
tee, and begs to be excused from the meeting
August the 25th. The Society would like
ake this opportunity of denying the state-
ent which has appeared in the Press that
y had suggested the name of Sir Reginald
Blomfield as a suitable architect for the present
et improvement, but assure the Improve-
ments Committee of their whole-hearted support
this or any other scheme for enhancing with
nity or beauty the amenities of the City con-
ent with a due consideration of the interests
the ratepayers.

I feel that the present situation is very
ortant in its bearings on our Society in its
tion to civic activities of this kind, and I
strongly that as a Society we should avoid
ting ourselves in a position which may
e incumbent on us to serve the interests
a Corporation until we are assured that
e are also the best interests of the city and
ens. With the information so far vouch-
ed to us, we are not in possession of this
arance.

"Yours sincerely,

"JOHN E. PROCTER.

W. Alban Jones, Esq., President, The Leeds
and West Yorkshire Architectural Society.

August 24, 1925.

hairman, The Improvements Committee,
Leeds City Council.

DEAR SIR,—At our interview on the 21st inst.
ut forward a private letter to myself from
of our members because it epitomised the
ons that led my Council unanimously to pass
resolution forwarded to Mr. Lancashire on
20th ult. I put forward Mr. Procter's
ession of opinion primarily because it was
rsed by my Council, but also because he is
osition to voice the opinions of the younger
bers of our profession through having
ted much voluntary service to the cause of
itectural education in Leeds.

ou stated on Friday that it was impractic-
to put into writing the duties and responsi-
bilities of the suggested three advisory archi-
ts, but mentioned that "goodwill" was one
he main essentials. I have a similar diffi-
y in exactly defining questions mainly of
netics, and am thus prompted to rely on
somewhat informal letter as being the best
ns of explaining the attitude of my Society.
Officially, aesthetics may not be recognised,
you will agree that they persist in being the
salt of life. I offer no excuse in referring
to the Charter of Youth contained in
rie's Rectorial Address at St. Andrews as
rding the right cue as to what has happened
his Society.

is the younger men challenging the favours
nually going to their elders. These
nger men look round and see a University
eds, standing for local culture, they view
outward architectural manifestation—the
k of accomplished Londoners of their day—
do not feel impressed.

he Victorians gave a young Brodrick his
ce to emerge with the Leeds Town Hall
other works, which alone almost of the
lings of yesterday in this town remain of
real architectural distinction. Why should
these men at least press for a similar chance?
r seniors, perhaps, whisper counsels of
macy, tell them they are exceeding the
of gentility in referring to these realities,
the die has once again been cast by their
s, and it but remains for them to serve
wait till they, too, are old, retaining only
nspiration of the aged.

the present case, these younger men,
ng how best they can serve, are told that
ecomplished London architect, whom all
et, full of years and honours, has already
ommissioned to design and fully detail
half a mile of street façade in Leeds, and
courteously requested that three local
ects should act in an advisory capacity
him. The duties of these architects may
y not, involve important mundane decisions

affecting the very essence of the scheme, which,
if efficiently collated, would leave a clear field
for the more alluring function of pure design.
These architects are told that these duties
cannot be reduced to terms of reference, and
may involve those of the critic, but with "good-
will" it is hoped that any differences between
them and Sir Reginald Blomfield may be
settled before the design is laid before the City
Council for approval.

The younger men (and many of the older
ones) whose opinion I voice, say that respect
for the years and honours of the designer
appointed forbid them, at any rate, rendering
efficient service as critics, and say, let our
resolution of the 18th stand, as we think it
wiser that they who appointed Sir Reginald
Blomfield should be free to appoint the advisers
(even if from members of our Society) whom
they may consider best adapted to avoid any
impasse that may hinder the scheme. I find,
Sir, that the McConnachie of Barrie in me
insists on my endorsing the position taken up
by the younger men with whatever weight
there may be in the presidential office of this
Society.

Yours faithfully,

W. ALBAN JONES, President.

6, Butts Court, Leeds,

August 27, 1925.

DEAR SIR,—Your kindness in sending me an
early reply enabled me to read your letter to
a meeting of the Improvements Committe
on Tuesday afternoon, and this resulted in our
asking three Leeds architects if they would act
in the capacity we suggest. Whilst sympathis-
ing with your idea that the fullest opportunities
should be given to younger men, I am still of
the opinion that the course the Committee has
adopted was best calculated to obtain power to
insist on a better architectural scheme for the
widened street than has resulted from previous
efforts, and I only regret that your Society will
not be officially connected with us in doing this.

Yours faithfully,

CHARLES LUPTON.

W. Alban Jones, Esq.,

56, Prudential Buildings, Leeds.

[Some passages which do not affect the
principle of the question at issue have been
omitted from the above letters.—Ed.]

SCHOOL PROSPECTUSES. CENTRAL SCHOOL OF ARTS AND CRAFTS.

WE have received the prospectus of the
L.C.C. Central School of Arts and Crafts,
Southampton Row, W.C.1, of which Mr. F. V.
Burridge, R.E., is the principal. Architecture
and the building crafts are dealt with ex-
haustively, the instruction being planned for
architects' pupils and assistants and those who
are working for the R.I.B.A. examinations. It
is also for craftsmen and others who require a
knowledge of architecture, and the day instruc-
tion under Mr. C. Spooner, F.R.I.B.A., is
limited to this purpose; it comprises the study
of historical examples, design, preparation of
detail drawings, perspective, etc., and weekly
visits to the museums. Drawing and T-squares
are provided, but students must have their own
instruments and materials. There are two
courses of building construction, a senior and
a junior, both of which can be attended simul-
taneously, if desired. The junior deals with
the elementary principles of building and a
grounding in the primary crafts, viz., brick-
work, slating, plumbing, etc. The senior is
advanced and covers such subjects as ferro-con-
crete construction, girdering, sanitation, etc.
Lectures are given on "The Growth of a
Building," being based on working drawings
and specifications of recent structures. There
is also a course on structural mechanics, the
syllabus of which deals with stress and strain,
factors of safety, reactions, etc.

MANCHESTER UNIVERSITY SCHOOL.

We have received the prospectus of the
coming session from the University of Man-

chester School of Architecture, of which Prof.
A. C. Dickie, M.A., F.S.A., A.R.I.B.A., is
the principal. The school is one of the "re-
cognised" schools of the R.I.B.A., and its
examinations are accepted as equivalent to
those set in the Intermediate and Final Ex-
aminations for the Associateship of the
R.I.B.A. The courses are intended to meet
the needs of students who desire (1) to take
a degree of the University with Honours in
Architecture in the Faculty of Arts, and (2)
to take the certificate of the University in
Architecture.

These degree and certificate courses are full-
time courses and are arranged to cover a period
of five years.

In Building Construction lectures and
demonstrations include construction in the
various building trades, sources of supply, and
qualities of materials. The second, third,
fourth, and fifth years include graphic statics
and calculations, structural steel work, and
ferro-concrete. Visits are made to buildings
in course of erection throughout the course.

There are many handsome scholarships
open to all members of the school; intending
students should write to the Secretary for par-
ticulars of the entrance scholarships before the
session commencing on October 8.

CITY OF LONDON COLLEGE

WE have received particulars of a two years'
evening course on timber from the City of
London College, White-street, Moorfields, E.C.2.
The course has received the formal approval of
the Timber Trades Federation, and has been
arranged under the supervision of the College
Timber Trade Advisory Committee; Mr.
E. H. B. Boulton, M.C., M.A., is the head of
this section.

Section 1 of the First Year, consisting of
twenty lectures on Fridays, 6.30 to 7.30, to be
followed by practical work from 7.30 to 8.30,
commencing October 2, deals with the identi-
fication and uses of common timbers, a general
outline of the structure of timber, the identi-
fications and uses of softwoods and hardwoods,
and the identification of some common timber
trees. Section II deals with the seasoning,
preservation, defects, and mensuration of
wood.

The Second Year embraces sections on the
identification, properties, and uses of special
timbers; the timber supply from the forests of
the world; timber contracts, arbitration,
grading rules, insurance, &c.; and a compre-
hensive study of botany. Year certificates are
awarded to successful candidates. Intending
students should see Mr. S. J. Duly or Mr.
E. H. B. Boulton, on Wednesday or Thursday
evenings, September 23 or 24, 1925, between
6 and 7.30 at the College.

BRIXTON SCHOOL OF BUILDING.

The School of Building, Ferndale-road,
Brixton, has been established by the L.C.C. to
enable artisans and others engaged in the
building trades and allied professions to acquire
an intimate knowledge of the principles that
underlie the processes which they have to carry
out in their daily work. Workshops have been
provided and equipped for the practical teach-
ing of the several building trades under con-
ditions similar to those met with on buildings
and in builders' shops. A School of Archi-
tecture, with courses of instruction in the
history of building and for the study of archi-
tectural design and planning, together with the
preparation of architectural drawings, forms
part of the complete scheme of the work of the
school.

Lecture and class-rooms, drawing offices and
laboratories have been arranged in connection
with the workshops, so that the practical work of
the school may be combined with class studies
in-building construction, drawing, architecture,
&c.

Structural engineering, surveying, estimating
and other branches are all dealt with exhaus-
tively. Intending students should write to the
secretary, Mr. H. N. Hawley, for particulars
before September 25.

BOOK REVIEWS

Inigo Jones, by STANLEY C. RAMSEY; *Sir John Vanbrugh*, by CHRISTIAN BARMAN; *Nicholas Hawksmoor*, by H. S. GOODHART-RENDEL; *Sir William Chambers*, by A. TRYSTAN EDWARDS. (London: Ernest Benn, Ltd.) 10s. 6d. each.

Inigo Jones.—Inigo Jones is an outstanding figure in English history, a personality marking a definite revolution in English architecture, from that which was strictly national, or was at least of national growth, to that which was in all essentials Italian. During the Middle Ages English architects had solved the ecclesiastical, military and domestic problems set by their clients, as the change of conditions and advance of civilisation demanded, by the gradual development of a style of architecture having its origins in the earliest periods of the history of the race, and although foreign influence was considerable in practically all periods, the exotic elements were assimilated and the national character of the buildings was maintained. But by the end of the sixteenth century there was a growing desire for a change in line with the movements on the Continent, and it is a happy circumstance that the change when it occurred was introduced by a scholarly master. There are many points of resemblance between Inigo Jones and Brunelleschi, the great pioneer of the Italian Renaissance of about 200 years before, but the efforts of the former were in some respects more difficult in that while the change was more drastic a distinct national character was nevertheless imparted to the work produced. After two periods of study in Italy, the first about the end of the sixteenth century and the second in 1612-14, Jones returned to England and began that work which was to have such lasting effect. His earliest known building was erected in 1616 when he was in his forty-third year. The banqueting hall in Whitehall, admittedly one of the finest productions of Renaissance art, was built in 1619-21. What the result would be had Jones's Royal patrons been in possession of an ample exchequer or had he the opportunities of Wren it is not possible to determine, but there is a finish about his work which but few of his successors have attained.

The architecture of Inigo Jones was essentially civic in character, and this is observed even in those works executed in the country, such as Lees Court. But it finds its full expression in the colonnaded piazza of Covent Garden, with the church of St. Paul as its culminating point, and in the lay-out of Lincoln's Inn Fields. Jones, however, was probably not responsible for King Charles's Block at Greenwich, or for Coleshill House, traditions followed in this monograph. As Mr Alfred Gotch has clearly shown there is ample evidence to point to John Webb as the architect of the first and Sir Roger Pratt of the second. Further, the banqueting house in Whitehall was not built as part of a great palace, as so frequently stated, but the palace was designed many years afterwards, and probably by Webb, to include the banqueting house which was already built. Some fifteen buildings executed by or accredited to Inigo Jones are illustrated in this book by a set of very clear photographs, many of the works, such as Greenwich Hospital, Coleshill, and Wilton having several plates devoted to them.

Sir John Vanbrugh.—Vanbrugh is among those remarkable versatile characters who have been endowed with many gifts and have attained distinction in all fields of labour to which they have devoted their attention. A successful dramatist and operatic manager, he was, for some unknown reason, appointed in 1702 Comptroller of the Royal Works under Sir Christopher Wren, and the following year, when he was approaching forty years of age, we find him studying Palladio and entering definitely upon that architectural career in which he was to acquire such eminence.

Demonstration Bungalow, Winchester. MR. F. W. REES, L.R.I.B.A., Architect.

Castle Howard, Blenheim, additions to Greenwich Hospital, Vanbrugh Castle, and Duncombe Park, all of which are well illustrated in this volume, soon absorbed his attention and created for him a great reputation. Like most architects of great works Vanbrugh encountered determined opposition during the course of his work at Blenheim. In this case the opposition came from Sarah—the redoubtable Duchess of Marlborough—who accomplished his dismissal from his position of architect of the work in 1724, two years before his death, and twelve months later made an unsuccessful attempt to prevent his being paid for his services. Vanbrugh had the privilege of living in a period in which it could be said "There are several gentlemen in these parts of the world that are possessed with the spirit of building." This circumstance had its effect on the architects of the period, and is largely responsible for their designs for such desirable clients. Vanbrugh himself aptly expresses it by the order in which he states his reasons for the work he is carrying out at Lumley Castle. He says he is "altering the house for both State, beauty and convenience." In all criticism of his work this order must be remembered in which "State" comes first with convenience last.

Nicholas Hawksmoor.—That the bold outlines, the skilful distribution of solids and voids, and the monumental character of Hawksmoor's work have not been appreciated by all critics is obvious from the disparagement it has received from many quarters. Hawksmoor was born in 1661, became closely associated with Wren after 1679 and subsequently with Vanbrugh. Under the latter he assisted in the work at Castle Howard and Blenheim Palace, being in sole charge of Blenheim after Vanbrugh's dismissal in 1724. Many of his own masterpieces, including the churches of St. Ann, Limehouse, St. George, Bloomsbury, Christ Church, Spitalfields and St. Mary Woolnoth, the mausoleum at Castle Howard and the cupola and screen at Queen's College, Oxford, are all well illustrated here, and short descriptive notes are

given of each building. That fine pile, the west front of St. Mary Woolnoth, has been chosen as the frontispiece. St. Mary Woolnoth, is one of the nineteen churches not threatened with destruction, and it is hoped that the prominence here given to its fine facade will contribute its quota towards the prevention of the carrying out of that advised scheme.

Sir William Chambers.—The masterpiece by which the name of Sir William Chambers will always be known and honoured, which may well be placed among the great achievements of architecture in our country, is Somerset House. That merits of this building were not recognised all his contemporaries was but to be expected but there are few critics to-day, either professional or lay, who are not greatly impressed with the harmony and beauty of Somerset House. Both in respect to its fine front, rising above a terrace from a rustic base, admirably proportioned and having the reserved dignity which the river front of a great city building should possess; an respect to its general plan and the correspondence of that plan to its elevations, this building has indeed a grandeur combined with simplicity; it is fine in general conception in detail, which is all too rare. It is also a small tribute to the architect's ability to be able to state in regard to the planning of various blocks of offices of a great structure built nearly 150 years ago, that it appears to have given complete satisfaction to the occupants of these blocks.

Chambers was born in 1762, and spending many of his early years in travel to the East Indies and China, he turned his attention to the study of architecture, devoting some time to the study of the buildings of France and Italy. On his return to England he was fortunate in being introduced to Royal patronage, and in 1762 he was employed by George III. in the laying-out of Kew Gardens. He is responsible for many of the pavilions at Kew as well as for the Pagoda, in which his studies in China found expression. He also designed the entrance

at Blenheim and Wilton. As is desired, twenty-four of the photographs in this photograph are devoted to illustrations of the Rotherham House, of general views and details, and remaining ten illustrating work at Kew and elsewhere.

Rotherham Regional Planning Scheme, 1925. By W. R. DAVIDGE, F.R.I.B.A., F.S.I., Town-planning Inst. To be obtained, price 7s. 6d., from the Town Clerk, Municipal Offices, Rotherham.

The literature of Regional Planning is rapidly growing. To the several excellent reports on Regional areas already in existence, another has now been added—one dealing with Rotherham, by Mr. W. R. Davidge. This is a really comprehensive survey of the region, in the full meaning of that often loosely applied term. Mr. Davidge is an architect as well as a town-planner, and we are not disappointed in expecting from him a report that is not only entirely efficient in its analysis of the regional situation and in its practical recommendations, but one, also, that takes account of all the less material factors involved—topographical, architectural, historical. For example, the Report contains an instructive chapter on the growth of the region and its industries, wherein we find references to pre-Roman times, to ancient hill-forts, to the Roman occupation, to the Middle Ages, to mediæval developments, to the beginnings of Local Government, to the growth of nineteenth-century industrial enterprise. The historical survey is essential to a proper consideration of the problems of to-day. Mr. Davidge's brief though informative summary provides an excellent basis for the study of carefully arranged data and practical proposals which follow.

The Rotherham Regional Planning Scheme relates to an area of 70,127 acres, having a population of 168,895, a rateable value of £7109, and embracing no fewer than ten local authorities. It is an area that suggests active possibilities to the imaginative town-planner, (1) because of its close proximity with all the important manufacturing centres of South Yorkshire, embracing Sheffield on the west, Barnsley on the north-west, the busy manufacturing regions of Nottingham to the south, and the rapidly developing coal-fields of the Doncaster region on the east, (2) because the hilly nature of the region

as a whole has prevented the industrial development of the higher land away from the valleys, and, except for the development of the coal-mining industry, it is probable that the outlying villages will remain very largely agricultural communities.

This large, varied, and richly endowed area Mr. Davidge deals with according to the accepted principles of modern regional planning, dividing his recommendations under the general heads of (1) Improvement of present Transit Facilities; (2) New Road Proposals; (3) Preliminary Zoning of Areas for Industrial and Residential Use; (4) Reservation of Open Spaces; (5) Protection of Amenities; (6) Procedure Recommended. The Report is illustrated by a series of coloured folding maps and by many smaller maps and photographic views in the text.

Mr. Davidge has provided the Rotherham Region with a scheme that takes account of all the factors of future expansion. For its constructive ideas, well expressed in excellent English, it should be much in demand by students of Regional Planning as well as by those who are more intimately associated with the Rotherham district.

Elementary Guide to Reinforced Concrete. By ALBERT LAKEMAN, L.R.I.B.A., M.I. Struct. E. (London: Concrete Publications, Ltd., 20, Dartmouth-street, S.W.1.) Price, 2s.

This book has been specially written for all who wish to gain a knowledge of the principles of design and practice of reinforced concrete, and should appeal to the architect, builder, student, clerk-of-works, foreman, and all concerned with building. Differing from most text-books on the subject, it is written on the assumption that the reader has no previous knowledge whatever of reinforced concrete. The accepted methods of design and construction are explained in simple language, with a notable absence of equations. Seventy-nine diagrams are used to explain the text, and wherever possible such explanations are made clear by comparisons with everyday things in such a manner as to be readily understandable by the beginner. In the preface the hope is expressed that a study of this work by the builder's foreman will do much to improve the execution of reinforced concrete work, and if proficiency comes from greater knowledge this will be readily admitted. A simply written work such as this should also be of value to the student

and teacher, as the essentials of reinforced concrete design can be readily learnt therefrom by the student outside school hours. The chapters include: Loads, Reinforcement, Neutral Axis, Beams, Fixed and Supported Beams, Leverage of Beams, Bending Moments, Shearing, Stress, Slabs, Columns, Walls and Bases and Foundations.

Estimating for Builders. By J. H. BARNES, Fellow of the Institute of Builders. (Published by *The Builder*, Ltd., Catherine-street and York-street, Aldwych, London, W.C.2.) Price 6s. net; post free 6s. 6d.

The fact that the author is a director of one of the largest of the London building firms, and, in addition, is entitled to use those mystic letters, F.I.O.B., is some guarantee that any work to which his name is attached will be of practical value, and an examination of the volume before us will bear out this statement. Any work of this kind must necessarily confine itself to one district, in this case to the London area; but it will be a comparatively simple matter to apply the information to other districts by varying the basis of labour rates and also those of materials which go to make up the various prices.

In many works giving analyses of prices, the calculations are so detailed that it would not be possible to spend the time necessary in the hurry of modern business; those here given are not open to this objection, although quite sufficient as a guide to enable anyone who takes up this department of building practice to produce consistent estimates, always bearing in mind that no work, however detailed, can make the mere novice into a competent and reliable estimator. As a guide to the systematic building up of prices this work will be found most valuable. In addition to the various analyses, the various practical notes throughout the trades explaining the bases of the several factors both for labour and material add considerably to the value of the information.

May we appeal to our correspondents to submit their queries on paper of a size easily filed, and written as legibly as possible, or, better still, in typewriting?—ED.

Architect's Fees for Abandoned Work.

[REPLY TO B. WARE, SEPTEMBER 11.]

SIR,—An architect's right to remuneration depends on a contract to pay what is reasonable; and if there is no agreement, then he is only entitled to a reasonable remuneration. In this case it is quite clear that there must, on the facts as stated, be in existence an express contract, made orally, fixing the remuneration of the architect for the house finally adopted and built at "the originally agreed fee," and this last is all he is entitled to recover. Certain institutions, e.g., the Royal Institute of British Architects, have prepared scales of professional charges, but, however reasonable they may be, unless they have been agreed to the parties are in no way bound by them. If there is no express or implied stipulation that no payment is to be made until the work is completed, the architect is entitled to payment, from time to time, for the work actually done; but here the fee was to be paid for the entire work on completion, therefore the right to payment does not arise until the whole of the work is completed—which would appear to be at the end of the maintenance period, and after any necessary repairs and making good are finished, and the final certificate has been given. The fact that the client took possession does not affect the question of when the remuneration is payable. See Cresswell on "Building Contracts," 143-147.

"LAW."

Water in Basement.

SIR,—Will you please tell me what I should do to make a basement floor absolutely waterproof? I have a job in hand where the basement floor is of 8 in. concrete (4:2:1 mixture with 50 per cent. waterproofer) with a coat of 1 in. cement plaster (2:1 with 50 per cent. waterproofer on the top), and yet water is coming through. I have got to dry it completely to lay three courses of damp-proof material. I have tried various methods to stop the water but have failed. It is the rainy season here now, and the subsoil is full of water.

"A BUILDER'S ASSISTANT."

Rangoon.

Roofing Felt.

[REPLY TO "CLIMATE," SEPTEMBER 4.]

SIR,—From personal experience, I find there is nothing to choose on the point of utility between bituminous roofing felt and hair felt, except on the question of cost. Bituminous is cheaper and quite suitable as an under lining.

G. W. H.

SIR,—The purpose of a roofing felt is to form a non-conductor of heat rather than to form a second line of defence against weather. For this reason a well-tarred hair felt is preferable to one of the more compact bituminous felts. To preserve it against decay and give it the longest life possible, the roof should be provided with vertical battens as well as horizontal slating battens to maintain a through current of air, and at the same time eliminate the series of damp collecting ledges that occur if the horizontal battens are laid direct upon the felt.

"EQUABLE."

Tiles Splashed with Cement.

[REPLY TO "CEMENT," SEPTEMBER 4.]

SIR,—I have found that such stains as described by your correspondent will yield to a good scrub with strong vinegar.

"ACID."

Cold Water Supply.

[REPLY TO "QUERY," SEPTEMBER 4.]

SIR,—Since your correspondent mentions a school building, it is obvious that there will be long intervals in the holidays during which the heat will not be on. It is therefore doubly necessary to wrap the cold pipes, because a burst pipe in a permanently-sealed trench may be a very serious matter, and at the same time cold pipes running alongside hot pipes will often run warm at the tap.

"INSULATE."

Provincial Architects' Practices.

[REPLY TO MR. FREEMAN, SEPTEMBER 4.]

SIR,—The practice described by your correspondent is, to say the least, "doubtful," and where cases are known and can be proved, it would be a public service to report the offenders to the R.I.B.A. All "buried fees" are objectionable, and where local practice admits of the architect drawing from the contractor, it behoves him to be extra scrupulous. Another pernicious practice of only slightly less guilt is to include in quantities a quantity of stuff which it is known will be varied in execution. In squaring up the accounts the offender charges 2½ per cent. on additions and 1½ per cent. on deductions, thus getting a double commission on perhaps a large bulk of the work. It is really only fair to charge for measuring variations that are directly required by the client or which other changes in the job render desirable for the good of the job.

"JUSTICE."

Quantities.

Please give me your opinion on the following clause taken from the bill of quantities supplied by a Rural District Council:—"If at any time during the progress of the said works or after the completion thereof any disputes or differences arise as to the manner of executing the said works or any part thereof as to the quality of the materials or as to any matter of charge or account between the Council and the contractor, or as to any matter or thing connected with the contract, they shall be referred to and finally settled by the surveyor, whose decision shall be final and binding on both parties."

C. H.

Permanent Colouring of Roughcast.

SIR,—Can you tell me how to make the cream colour of rough-casting permanent?

R. M. P.

Preservation of Bath Stone.

SIR,—Could you advise me as to the preservation of the Bath stone dressings of a small house in a western suburb of London? Is paint deleterious? I should like to avoid paint if possible, as it hides the appearance of the stone.

"VOX."

Preventing Verdigris on Copper Pipes.

SIR,—We should be glad if any of your readers could suggest a method of treating copper pipes to prevent verdigris forming. Would two coats of varnish be an efficient preventive? Opaque paint is not desired.

J. B. HUTCHINS, F.S.I.

(T. Wainwright & Sons).

A Boundary Wall Question.

[REPLY TO "J.," AUGUST 28.]

SIR,—My opinion is that the cost sustained by "A" in building the wall at pre-war prices should be halved, and one-half charged to "B." That seems to me to be equitable, as "A" has not suffered the increase of present-day prices.

E. J. P.

Penalty Clause in Contract.

SIR,—Could you inform me whether it is possible to enforce the penalty clause against a builder where the R.I.B.A. Contract has been signed, but no provision has been made for bonus, should the builder finish before the time agreed upon? Has any case been decided on this point?

W. L. CARTER.

Bituminous Paint.

SIR,—I should be obliged of any information or theories as to how to overcome the following difficulty:—

Several steel casement windows have been recently been glazed and puttied and painted with bitumen; as soon as the paint has been done it seems to "rise," and has a blistered appearance; the putty was smoothed down reasonably.

J. A.

Dry Rot.

[ANSWER TO "ANXIOUS," AUGUST 28.]

SIR,—(1) Take up boards of floor here and there and distribute evenly over all under surface from 1 to 2 in. thickness of quick-growth stone lime, or (2) Take up floor, remove to depth, or put on top, as there is said to be 2 ft. of space, 4 in. cement concrete, floated top with cement, waterproofed. Some years ago I had a floor under which evidently the sun had got in, and growth and mould had not been removed. The smell in the room was offensive, and the bleached fibres crept through the skirting and floor joists. I acted as in No. 1, and the nuisance was abated and destroyed.

E. D.

DOMESTIC HOT-WATER SUPPLIES AND PLUMBERS' CLAIMS

WE are asked by the Secretary of the Yorkshire Riding Federation of Master Plumbers' Association, 103, Beckett-street, Leeds, to publish the following letter received by him from the Leeds and West Yorkshire Architectural Society.

[COPY.]

AUGUST 20, 1925.

DEAR SIR,—The question of demarcating the work of domestic hot water supply as between plumbers and heating engineers has been referred to the Society by the National Association of Master Heating and Domestic Engineers for reconsideration of the resolution passed at the Council meeting of the Society on April 1924, and subsequently notified to you on May 11, 1924, viz:—

"That the domestic hot water supply should be kept as plumbers' work and not given over to the heating engineers."

And I have to inform you that in view of the information which the Sub-Committee appointed to inquire into this question placed before my Council, and having regard to the arbitration awards of the Board of Trade on November 30, 1909, and the Federation of Engineering and Shipping Trades of June 1920, in regard to this matter, and also of the decision of the Royal Institute of British Architects after their prolonged enquiry relative to this disputed question, the Council feel that the matter should not have been referred to the Society for local action in regard to a question which concerns the trades generally throughout the country, and is purely a trade question. The Society, being only concerned with the improvement and efficiency of craftsmanship, cannot lay down any rules regarding demarcation of work as between trades.

Further, I am to inform you that at a meeting of this Society, held July 24, 1925, it was resolved to rescind the resolution passed at their meeting on April 8, 1924, viz., "That domestic hot-water supply of a building should be kept as plumbers' work and not given to the heating engineers," and write this notifying your Association accordingly.

Yours faithfully,

(Signed) F. L. CHARLTON,

HON.

THE BUILDING TRADE.

THE ADMINISTRATION OF THE HOUSING, &c., ACT, 1923

By W. H. DUDLEY.

its adherence to the owner-occupier in housing, and its already proven success, the Chamberlain Act has certainly not the fact that it is a fine piece of constructive legislation. The figures enumerating the number of houses built, and in course of construction under its provisos, are sufficient evidence of this. The subsidy house figures at the passing of the Act (July 31, 1923) and July 1, 1925, are:—

	Private enterprise.	Local Authorities.
Completed houses ..	65,484	23,943
In construction ..	31,593	11,214
Proposed but not yet commenced ..	62,357	19,882
	159,434	55,039
Total	214,473	

representing two years' working, these figures constitute an average provision of 16 houses per annum towards the solving of the nation's housing problem. They also provide ample evidence that under wise and constructive legislation, the thrifty working class are quick to undertake the solution of their own individual housing burdens. The Chamberlain Act, makes for pride of ownership, resultant self-made effort, and is the means whereby a higher degree of citizenship is attained.

As at first a cause for disappointment, the enactments were of a permissive nature, and local authorities might use their own discretion as to adoption. The fact that they either accept or reject the proposals, and the event of acceptance might impose any conditions they deemed fit, led to a certain conservatism as to the outcome. And it must be noted that in certain parts of the country doubt has been justified, although, happily, there are now distinct signs of a more even distribution. In spite of this, however, it is very necessary that pressure be brought to bear on lagging local authorities to adopt the Act and operate them in the widest possible extension, so as to ensure that the thrifty working classes may be able to procure reasonable accommodation. The houses already erected represent only those districts where the local authorities have taken place and the number could be materially increased.

The importance of this Act cannot be too highly appreciated, seeing it is the only post-war enactment which has been attended with economical success. The former Acts, perhaps providing numbers of houses, have not financial burdens on the country, this is especially applicable to the Addison Act, which left behind it a bill for £1,000,000. The 1924 Wheatley Act has yet proved in full operation, and even if it is not the financial burden entailed will be less, amounting as it will do to £540 per house.

This figure is not the cost of building, but the assistance which will have to be borne by the tenants, over a period of 40 years, for the redemption of the houses. The vast amount may be gauged when it is realised that the proposed erection on this basis of 100,000 houses, up to the year 1934—thus the total subsidy £810,000,000. The fact stands alone, and without denial is the salvation of the housing shortage. Indeed, in comparison with that of the Addison Act, is trifling, and this alone, from the public's point of view, should be a great attraction.

When the Labour Government took office it was anticipated it would seek to nullify the 1923 Act and thus create a set-back to private enterprise. The Act had then been in operation only a few months, but its initial success had been so profound, and the figures of houses built were so overwhelming, that even the Labour Health Minister could not refute the claim that the Act should continue. Indeed, its fundamental basis of action was so sound that it was found a worthy foundation upon which to erect the framework of the Wheatley Act, with the result that the two Acts now run somewhat concurrently. Formerly, the 1923 Act subsidy was to cease in 1926, but under the 1924 Act it was made to continue for the period of the proposed Labour housing programme, i.e., until 1939; while the loan provisions were continued permanently.

In view of the rapid progress the Chamberlain Act has already made in housing, it cannot be too strongly urged that no curtailment of activities under its jurisdiction should be made, but that, on the other hand, as much stimulus as possible should be given still further to accelerate its operation.

It is evident that there is a prevailing ignorance in the ranks of local authorities of the wide powers the Act confers upon them, and the Act itself is little understood. In many districts there is a tendency to adopt only the subsidy clauses to the exclusion of the loan provisos, or to adopt the loan clauses without the subsidy. Such adoptions do not render full assistance to prospective purchasers; at the same time, they rob the Act of its most vital asset. To solve local housing problems quickly, it is necessary and of great importance that action be taken both in the subsidy and loan clauses, as only by this method can the assistance afforded reach the class for whom it is intended.

Ministry of Health Circular 571, with its Model Pamphlet to Local Councils, is invaluable in its advice as to mode of procedure recommended in operating the Act, and is worthy of diligent study by all members of local bodies. It suggests that these bodies should, by means of issuing handbills and by other like methods, bring the knowledge of the facilities offered before the general public. It further points out how, by a generous administration, a prospective purchaser might buy a subsidy house on an initial outlay of £50.

The fact is, however, that comparatively few councils have adopted the loan and subsidy provisos *in toto*. In the London districts generally there is little room for complaint as to advances on loan, but subsidy operations are somewhat lacking, while in parts of the Midlands and the North, the reverse seems the case, and the loan part of the Act is worked poorly.

It is encouraging, nevertheless, that the functioning is tending to become more even and rational, but it is imperative that still greater efforts should be made on an intensive scale to bring the Act to its full fruition. This can be accomplished by an understanding cohesion between municipalities and private enterprise house builders. It cannot be denied that, even though in some cases the conditions imposed have appeared onerous, private enterprise has shown its willingness to develop under the legislation afforded, and it is to the credit of the builder that the vast number of houses erected during the past two years have been built in a very difficult labour market and when a shortage of materials has existed.

It could not, of course, but be expected that

so bulky a scheme should have many difficult questions in its operation, and a due study of the practical inner details is of value. When the 1923 measure was in debate many builders changed their style of development from the larger class of villa to houses within the prescribed subsidy area, assuming that this would be sufficient qualification for the grant, Circular 388A, published soon after the Bill was made law, however, laid down that any houses erected prior to the Minister's approval would not rank for subsidy. On behalf of the builders it should be stated it was generally understood and anticipated that the date would be fixed from the time of the Bill's first meeting.

Until recently, provided they conformed to conditions as to size, &c., there was no fixed stipulation as to selling prices of subsidy houses. It was made a matter of understanding between the Council and the builder, according to the class of house erected. This method not only led to price variations in different districts, but tended to unevenness within localities themselves. During recent months, therefore, local authorities have, with the approval of the Ministry of Health, stipulated subsidy selling prices at a figure which they consider compatible with local conditions. There were many reasons no doubt why such a procedure was desirable, but the fixing of these prices has certainly proved a mixed blessing to private house builders. In the London areas especially was evidenced a distinct set-back, even in the comparatively small amount of subsidy building then in progress. The London County Council fixed their price at £725 freehold. In view of the extremely high cost of land in the Metropolitan area it was not to be wondered at that even the optimism of the house builder was somewhat quenched. Some of the Northern authorities, too, fixed their prices so as to include paving. In these districts a very large amount of paving has to be executed at the rear of the houses, in addition to the frontage, and it can well be imagined that this item of cost was a very serious one.

In many cases the present subsidy price limits preclude the house builder from developing in the manner habitual to him. He is unused to working to a fixed price. He does not build to contract, but shoulders the responsibility of his job from its inception, both financially and structurally, and completes it solely on his own initiative. He is dependent on sales for the return of his money. During the continuance of his development he watches carefully for opportunities of improvement, and each house erected is a progression on the last. To a bona-fide house builder the convenient planning and the design of his house is his stock-in-trade and advertisement, and though he is generally not accredited with the aesthetic eye, he is very well aware of the finishing touches which will appeal to his purchasers. Stereotyped designed houses have become an eyesore to him. In working to a price he is not able to indulge in any extras in finish, and has often to refuse the installation of more expensive fittings ordered by a purchaser, as any extras thus ordered, by being made an addition, might bring the price of the houses outside the bounds of a subsidy grant. Builders are, however, acclimatising themselves to these new conditions, and building rapidly.

The average of price limits imposed, apart from larger cities where harder conditions attach, is £650 to £675 freehold, including the subsidy. The impression that the subsidy goes to the builder is erroneous; the subsidy is granted on the house, and the purchaser in every case receives the benefit. Thus a builder would receive the full price of a £675 house, and the actual cost to the purchaser would be £600.

On the loan side, local authorities are allowed either to advance under Section 5 of the 1923 Act, or under the Small Dwellings Acquisition Act. The former allows an advance up to

90 per cent., with a repayment period up to 20 years, on houses to a fee simple value of £1,500, according to local authorities' surveys. The Small Dwellings Acquisition Act allows of like conditions, restricting, however, the fee simple value to £1,200, and making the repayment period up to 30 years. In either case, most authorities stipulate the repayment period as 20 years or less. The percentages of loans granted on certified values, however, show wide variance, and loans to the full 90 per cent. prescribed are the exception rather than the rule. The curtailment of loan percentages appears most apparent where local councils have adopted both sides of the Act. This is instanced in cases where the applicants are able to obtain a bigger advance under the ordinary building society regime than through the local council. There should be no hesitancy on the part of councils to assess the value of any house on a figure representing the purchase price, less the subsidy. In fixing the prices, they satisfy themselves that the figures are reasonable ones, and they are not asked to loan 90 per cent. of the purchase price, but on the "mortgagor's interest in the property"—which is the price fixed, less the subsidy. The £75 should take the place of the reduction made on current value and in forming the allowance made in arriving at the mortgage value. On this basis, with the subsidy assistance, a prospective purchaser might buy a £675 house on a cash outlay of £60, the local authority loaning £540 on £675. This would make the full 90 per cent. on the mortgage value, and a reasonable advance of 80 per cent. on the selling price. The working along these lines should prove quite effective, especially as the borrowing powers conferred on local authorities present no obstacle. The same applies to the procurator of subsidy benefit in those districts where it is proved to be needed.

The position of local authorities in regard to the administration, however, must not be lost sight of, especially in the extra work entailed on their surveyor's staff. This is undoubtedly heavy and is a serious addition to an already busy department. There are few districts where there is not a rapid erection of houses, and this alone would keep the staff fully employed. It is nevertheless important to bear in mind that the local and national housing needs call for the strictest urgency and that only good will and co-operation can tend to a rapid remedy. That it is sometimes extremely difficult for a local council effectively to set the necessary machinery in motion is granted, and owing to this, it would be well in the interests of the community for county councils seriously to consider the powers conferred on them by Section 12 of the 1924 Act (Section 85 of the Housing Act, 1925). This entitles them to borrow money for the purpose of loaning on houses, under Section 5 of the 1923 Act. Their larger working capacity allows of a wider and more easy administration, by which they are able to study the needs of borrowers more efficiently than is the case with the smaller councils. In leaving the administration of the subsidy to the local councils, and of the loans to county councils, the 1923 Act would, no doubt, be assisted to a very much greater measure of success. The county councils could work in cohesion with the urban councils and in this manner the work would be more evenly divided. The London and Middlesex County Councils have set a lead in this respect and their adoptions have been of the greatest benefit to owner occupiers. The time has certainly arrived when county councils should be urged to bear their part in the solving of housing, so that the needs of the areas they control might speedily be met.

There is no doubt that the thrifty working classes, who, with assistance, are capable of becoming owner-occupiers, should be made more cognisant of the facilities offered under the Chamberlain Act, and that no opportunity should be lost of creating an owner-occupier wherever possible. In this manner a very large part of the housing problem might be eased with the least expense to the nation.

THE TRADES UNION CONGRESS.

PRESIDENTIAL ADDRESS.

THE Trades Union Congress would be an event of the greatest importance, eagerly looked forward to, and its proceedings carefully weighed and studied, if the leaders of the trade unions made these proceedings an opportunity for expressing an opinion on how the difficulties experienced in the past year in the industrial world, as we know it, could be overcome, and the differences between employers and employed adjusted to the benefit of the nation as a whole, under the system which prevails throughout the world with the exception of Russia and possibly Mexico. But this year, as last year, the presidential chair was occupied by one who advocates sweeping away the whole system tried and known in every country except Russia and Mexico, and joining those countries in the ventures which have been made in them, and with what results we know, and as to the present position of which evidence is most conflicting. Mr. Purcell, the President last year, only recently, as we pointed out in these pages, again stated that, in his opinion, "the time has come when we have got frankly to admit the failure of capitalism and to take steps to break the capitalist system and reconstruct world economy on an entirely new basis; to do that it is necessary to develop a power capable of smashing capitalism and reconstructing society." His successor in the presidential chair (Mr. A. B. Swales) this year expresses the same views and advocates the abolition of the capitalist system, and holds up Russia and Mexico as the "beacon lights" we are to steer by. The first question the practical and unemotional British workman will ask himself will be, "Do those countries display 'beacon lights,' or are not his leaders rather following 'will-o'-the-wisp' vapours?" The evidence on this point should be overwhelming and convincing before any movement is put on foot, and what evidence does Mr. Swales offer? He tells Congress that the Report of the Trade Union Delegation of last year can be looked upon as the first text-book on the position in Russia.

We need hardly comment upon that Report. It is in conflict with observations made by the International Labour Office of the League of Nations (and the Labour Party expresses confidence in the League of Nations); it is also in conflict with the reports received from independent residents and eye observers of conditions in Russia, and it was also made by persons who, from their ignorance of the language and the country, were compelled to place themselves under the guidance of those experts in the art of propaganda, the members and officers of the Soviet Government. We would ask Mr. Purcell and Mr. Swales this question: If they were the controllers of a going concern in this country, would they scrap their machinery, dismiss their operatives, and reconvert their business because they had sent out a representative to a trade rival, ignorant of his language and the conditions of his trade, and thus completely in his hands, and this representative, on the strength of information imparted to him through an interpreter and under the guidance of a foreman, reported that the business methods of this trade rival were better than those they had tried for some centuries—they and their forbears? Would they not first ask to see the books? Would they not like first to see the actuarial reports? Would they not even then inquire into the different conditions prevailing in that business and see whether these did not go to the root of the matter?

The whole burden of Mr. Swales' presidential address is to hurry the nation towards taking this leap in the dark, or to set out on this voyage of adventure, with as its only chart or "Pilot's Handbook," the Report of the Trade Union Delegation of last year. It is somewhat difficult to reconcile the statements made in the earlier part of the presidential address as to conditions and movements here with the avowed

policy expressed in the rest of the address: overthrow and change the existing system of society. Mr. Swales is reported as saying working people here had been called upon to make enormous sacrifices during the period of depressed trade. This statement by itself is possibly exaggerated, but not untrue: a nation that has been engaged in a life and death war is compelled to make sacrifices, not only during active operations, but after the struggle is over. But then the report of his presidential address continues: "The organised workers had a great deal to say in the last four years an impressive demonstration to the whole world of their unity and purpose, their capacity to make sacrifices, the cause in which they believed, and to maintain the industrial organisation they had built up." This sentence appears to assume things; first, that the cause in which organised workers believe, i.e., trade unionism, is Mr. Swales' cause, the destruction of socialism and capitalism, and, secondly, that if a drastic course is adopted the industrial organisation will be maintained, and both these assumptions, we think, are not well founded. A great mass of the working population of this country, and by the working population we mean the population which earns its bread by the work of any kind, is by no means prepared to join the few leaders of the trade union movement in favour of a revolutionary change, and, clearly, despite oratorical perorations, that a course would not tend to maintain the industrial organisation which they have built up. They look to their trade unions to take steps to secure them the best terms as to wages and working hours which can be obtained, and in our opinion they certainly do not look to their unions to lead them to a revolution. It is time that the members of the trade unions should take note as to the course of their leaders such as Mr. Purcell and Mr. Swales are endeavouring to make them take.

This presidential address is to us very interesting reading. This country stands in a unique position since the war, as do all the countries which were directly or indirectly affected by it, which, in fact, means nearly all the countries of the world. Peace and goodwill are vitally important both at home and abroad, but a militant attitude is preached, strife is encouraged between employer and employed, and between the trade unions and the nation, and to attain this end, not improved industrial conditions on a basis as accepted by the great majority of civilised nations, but to wreck that basis, and to embark on a wild adventure—the creation of a system which it is incontrovertible has caused intense suffering, at any rate in the early stages, in the countries that have adopted it, the ultimate success of which has never been proved, and which at this moment is costing Russia for pecuniary assistance a large part of the financial world. The future Mr. Swales and Mr. Purcell point to is less charted than the one known in these days as the New South Wales.

Bricks for United States of America

The Acting British Consul-General in San Francisco (California) reports that a certain State desire to receive quotations for common bricks, fire bricks and enamelled bricks. United Kingdom firms desirous of obtaining quotations in this case can obtain all particulars of the inquiry upon application to the Department of Overseas Trade, Queen-street, London, S.W.1.

"Notes on Slates."

With reference to the paragraph above subject in the Editorial Note of the issue for August 28, Dr. F. J. North, of the National Museum of Wales, points out that the pamphlet referred to was prepared in connection with the Museum part of that institution's scheme for disseminating useful knowledge. It can be obtained from the Museum, price 7½d., post free, a sale justifies such a course, other pamphlets dealing with the natural resources of the Principality will appear in due course.

SETTING OUT A STAIRCASE.—III.

(Continued from page 400, September 11.)

better method than those described to risers and strings is that known as the *veneer method*, in which the piece required is made up of thin layers of thickness bent round a drum. Between each there is a coating of glue, and the layers are pressed together by means of hand-screws, and left round the drum to set.

Another method of bending the riser of a bull-nosed step is that in which the veneer is bent round a shaped block. This block is prepared to the shape desired on plan and is made up in three thicknesses, which are glued and screwed together. Rebates are cut on each side for the housing of the riser face, the one on the newel side being undercut. The veneer is sprung from the newel end of the riser, which is cut out of a piece of pitch free from knots, is then marked. The

BULL-NOSE STEP

veneer in the block is then placed on this mark, and rolled round carefully on the back of the drum, and when the opposite rebate is reached the position is also marked, an allowance for the room being made. The material in between these marks, allowing $\frac{1}{8}$ in. for veneer, is cut away with the hand-saw and chisel. Two holes are then bored in the corners of the block, and after the face of the veneer has been wet with boiling water, the block is fixed in position by rolling the veneer round it, pressing down until the end is tight. Wedges are then driven into the space between the veneer and the block, and the block is driven in.

Tread.—The tread is the horizontal board on which the foot rests in passing up or down the stairs. It is made out of $1\frac{1}{2}$ in. stuff and is fixed into the strings at its ends in the manner described above.

Riser.—The riser is the vertical board supporting the tread cut out of $\frac{3}{4}$ in. stuff and fixed into the strings and notched into the treads.

The treads and risers are morticed into each other, the tenon at the top of the riser being cut at the back of the riser, and a cover mould is inserted under the nosing.

The bottom of the riser is tenoned into the nosing of the tread; the tenon being in this case cut in the front edge of the riser and the tread being fixed beyond the back face of the riser.

Rise is the vertical distance between the surfaces of two successive treads.

Going is the horizontal distance between the faces of two successive risers as distinguished from the tread, which includes the *Nosing*, is the outer edge of the tread projecting beyond the line of the face of the riser produced forwards. The nosing is either rounded or

moulded to save wear on the carpet and generally has a cavetto mould or quarter-round bead mould to cover the joint. This mould is frequently let into the underside of the nosing and butts against the riser face.

Margin is that portion of the string which rises above the line tangential to the nosings of the treads, and is generally formed in part by a capping mould housed over the top of the string into which the balusters are housed or tenoned.

Open Strings are also called cut strings, and have their upper edge cut out to line with the treads and risers of each step, their lower edge being parallel with the slope of the stair as with closed strings. With open strings the balusters are dovetailed into the treads, the treads being prepared to receive the dovetails on the balusters and cut on the nosings to mitre with the return nosing.

Housed strings are also termed closed strings, and have their upper and lower edges parallel with the slope of the stair. The portion above the line of the nosings is termed the *margin*, and that below the line of the backs of treads known as the *pitch line* is projected to receive the battens for lathing to, and has a splayed chase to conceal the joint of the plaster and string. The outer string is cupped underneath by a moulding housed on to its bottom edge.

The strings are housed out in their inner faces to take the ends of the treads and risers in the manner already described.

Wall string.—Where strings come against walls they are termed wall strings. And where one comes against a wall and the other is free the distinction is made by terming them *inner* and *outer strings*. The portion of the wall string above the steps is cut to line with the skirting running round the landing and at the bottom of

the flight a shoulder is formed to serve the same purpose, the strings being either halved, morticed or mitred to fit into the skirting.

Carriages are sometimes termed *rough strings*, and are the intermediate supports of unwrought timber $2\frac{1}{2}$ in. to 3 in. deep, placed at not more than 15 in. apart from centre to centre and notched out to receive the angles of the treads. To their underside are fixed laths to take the plaster of the soffit. As an alternative to notching the upper edges of the carriages, rough brackets are nailed to the sides of the carriages to fit up against the underside of the treads and against the backs of the risers. At the top and bottom ends of intermediate flights the carriages are birdsmouthed to the trimming joists and bolted to splayed pitching pieces.

A Wreathed String.—The strings as a rule

NEWEL STRING

LANDING

NEWEL POST

terminate in newel posts, but in a geometrical stair they are frequently bent round into a cylindrical shape at the landings and played out at the last two or three steps on the ground-floor level. It is then termed a *wreathed string*, which should be at least 2 in. thick, and may be close or open. The method of bending has already been described, and the string is sometimes strengthened by a flat iron bar being screwed to its bottom edge.

The *Soffit* is the underside of the flight, which may be plastered, matched boarded, panelled or left plain, in which case the woodwork will need to be wrought and stained, wax-polished or painted.

Capping.—Housed over the outer string is a moulded or chamfered capping into a groove in which the feet of the balusters are tenoned; alternatively the capping may be morticed or dowelled to the feet of the baluster. The wall string has a half-capping of the same design, with a rebate or chase on the back to cover the join with the plaster.

The capping where there is a newel is housed into it on the outer string and on the wall string, though the best finish is to insert a half-newel at a parallel position to that on the landing. This method is often omitted on account of expense, when the capping must be scribed to fit the skirting.

The width of the capping will depend on the design of the outer string and the size of the feet of the balusters.

On landings the string may be continued at a height equal to that of the skirting, in which case the capping will form its top member, or the capping only may be run along over the floor-boards, which are projected out beyond the outer string, which then becomes a fascia, and the ends of the floor boards are cut away, having a rounded or moulded nosing cut in and fixed under the capping.

Where the floor is trimmed at the top of the flight a fascia is fixed to the face of the trimming joists to line with and having the same detail as the outer string, and the capping may be treated in either of the ways described for landings.

As has been stated, a staircase in one flight and in one direction of ascent may be broken by a landing at any height that is found convenient. Such a landing is termed a *quarter space landing*; but where the landing is desired to serve as a turning place and is extended across the whole width of the staircase well, it is termed a *half-space landing*.

For its construction a trimmer is fixed across the width of the staircase and supporting bridging joists, which may be of smaller dimension than the floor joists, according to the span. The bridging joists are tenoned into the trimmer at one end and rest on the wall at the other. The newels are notched over the trimmer and take the ends of the carriages.

Winders are often introduced in the place of landings, and a half-space landing may be divided by one or more steps into two quarter-space landings; but where economy is studied the practice should be avoided and the introduction of one step into a landing should never be permitted unless no alternative is possible, as, apart from the danger arising from the unexpectedness of one step, the additional cutting and corners necessitated are out of proportion to the convenience gained.

In larger houses, hotels, &c., landings are sometimes extended across the width of a hall when they become galleries, and in such positions are often bayed out, as in the musicians' gallery of the medieval hall.

In staircases having the bottom flight divided into two running in opposite directions, a quarter-space landing is introduced at their junction and the flight continued in one.

The *Well* is a term used for either the whole space set apart for the staircase when it is termed either the *stairway* or *staircase-well*; or it applies to the space between the outer strings of two adjacent flights going in opposite directions, when it is termed simply the *well* or *well-hole*.

The *Going* of a tread is the horizontal distance from the face of one riser to that of another, as distinguished from the *going of a flight*, which is

the horizontal distance between the faces of the bottom and top risers of that flight. The *walking line* is an imaginary line on the stairs or an actual line drawn with the newel as centre and 18 in. as radius, on which winders are spaced out on the working plan. A *newel* or *newel post* is a squared or turned upright post at the bottom and top of a flight into which is run the outer string and handrail. It may be of a height sufficient only either to finish flush with the handrail or just to rise above it, or it may be carried up to the flight above, or again, as in a circular stair, it may run from top to bottom of the staircase.

Newels may be framed up, panelled, and carved elaborately, and where a narrow well hole is left between two flights instead of two

HANDRAIL SECTIONS

ordinary newels, one broadened out to take both handrails may be introduced with effect and saving.

The heads to newels may be left square, or moulded, and finished with balls on moulded bases or carved with figures.

A *Mitre cap* is the moulded top of a newel post into which the handrail is mitred in cases where the handrail itself forms the top of the newel.

Where a wide handrail is employed, a newel may be composed of four balusters set in a square supporting the handrail embossed out.

The *Handrail* is generally at from 2 ft. 4 in. to 2 ft. 6 in. above the nosing of the tread. It is housed at its ends into the newels, and into a chase cut in its underside are housed the balusters. Handrails on landings should have a height from 2 ft. 8 in. to 3 ft. 3 in.

A *Mop-Stick Handrail* is one circular or horseshoe-shaped in section, and is generally made of oak or other hardwood waxed-polished.

Following is a description of the method of laying out a template of a curved string for treads and risers, referred to on page 400 (top of first column) of our last issue:—

A semi-circle 1, 2, 3 is described, having the same radius as the cylinder, and then with 1 and 3 for centres and 3, 1 for radius, arcs are

described which cut at 0. From 0 draw a line through 1 to 4 and likewise through 3 from 0 to 5. The distance from 4 to 5 indicates the length of the true length of the semi-circle curve 1, 2, 3. The risers 13 and 14 are now dropped vertically to where they cut the line 4, 5, and the points of intersection marked 6 and 7. From *c*, *n* and *d* draw up vertical lines, and upon the line draw from 13 to set off from 6 the height of two risers at 8, 13. From the point 13 draw the line horizontally, and from *Z* measure vertical the height of one riser marking the end of the line 14. Next from *S* draw a line to 12, and set off from 12 to *h* the height of one riser from *h* draw the horizontal *h*, 11 to give the pitch line from 15 to 16. Next draw lines below the pitch lines so formed and parallel thereto. Take the distance from 15 to the line with the compasses and describe arcs with centres at *s* and *z*; join the intersection these two arcs with the bottom of the string with a freehand curve tangential to the arcs. Then draw a line through 14 and 12, and 12 and 14 at right angles to this line drop down to 15 and *h*. The pattern then formed gives the form for cutting treads and risers bent round the concave face of the cylinder.

(To be continued).

WAR MEMORIALS.

St. Bartholomew's.

The Governors of St. Bartholomew's Hospital have granted permission for the erection of a war memorial to St. Bartholomew's men, the utilisation of the archway beneath the North Wing.

Castletown.

Orlrig Parish War Memorial was unveiled in Castletown main street recently. Mr. Portmouth, R.S.A., designed and executed the memorial, which consists of a bronze figure representing "Remembrance" standing on Leggat stone pedestal.

Bailleul.

A war memorial was recently unveiled Bailleul, a Flemish town adopted by the City of Bradford, of which a delegation of Councillors was present. The monument stands on the site of the church of St. Amand, which was destroyed during the war, and is a copy of the ruined belfry and tower of the church of St. Vaast as they stood after the bombing.

Galashiels.

The Galashiels War Memorial is nearly completion, and will be unveiled in October; it is in the form of a 90 ft. tower, in front of which there will be a life-size bronze figure of a mounted Border warrior. The scheme, which was designed by Sir Robert Lorimer, A.R.A., also includes the extension of the Municipal Buildings.

Sheffield.

Sheffield's war memorial, which is to be the form of a tall steel mast, erected in the centre of the city, has arrived from Hull. It has been made by a firm of engineers. It is 108 ft. long, and consists of plates of $\frac{1}{2}$ in. thick; its width tapers down from 10 ft. to 8 in.

House of Lords.

The Select Committee appointed to examine the question of the available sites for a Peers' War Memorial in the House of Lords recommended that the alcove in the Gallery of the House of Lords should be selected.

Wallsend.

The Wallsend War Memorial Committee selected the design of Mr. Newbury Trevelyan, of Chelsea, for the local memorial. The estimated cost is about £1,200, and the monument will be of granite, 30 ft. in height, surmounted by a bronze figure of Victory.

NEW BUILDINGS IN LONDON.

on.—The rolling stock and carriage works on, W. 3, are to be enlarged for the Under Electric Railways Company of London, 55, Broadway, S.W. Plans by the company's engineering staff.

St. Pancras.—The proposed North-Western Polytechnic is to be erected in St. Pancras, at an estimated cost of £112,000. Mr. W. E. Riley, F.R.I.B.A., M.I.C.E., architect (Riley & Glanfield), 6, Raymond Buildings, Gray's Inn, W.C.

Sanderstead.—Plans have been prepared by Messrs. Greenaway & Newberry, Parliament-mansions, Victoria-street, S.W. 1, for a church at Sanderstead for the Parish of St. Mary. The building will be erected in sections, the first part costing about £9,000.

Shaftesbury-avenue.—A new theatre is to be erected by Mr. Frank Curzon, theatrical manager, 37, Bury-street, S.W. 1, who proposes to build on the site comprising 158-160, Shaftesbury-avenue and 9-13, Little Earl-street, W. 1. Messrs. Frank Matcham & Co., architects, 9, Warwick-court, High Holborn, W.C.

Sloane-street.—A large block of residential flats, with shops on the street level, to be known as Knightsbridge-court, is to be built

in Sloane-street, W.1, containing about 60 suites, in eight stories. Messrs. William Downs, Ltd., builders, Hampton-street, Walworth, S.E.17. Steelwork by Messrs. Banister, Walton & Co., Ltd., Trafford Park, Manchester. Messrs. Dudley, Newman & Elliott, architects, 29, Bedford-row, W.C.1.

Southwark.—A new boiler-house is to be erected at the works in Borough-road, S.E.1, of Messrs. R. Hoe & Co., Ltd., printers' engineers. Messrs. Robinson & Roods, F.S.I., architects, 37, Bedford-row, W.C.1.

Stamford Hill.—A new church, costing about £7,000, is being erected in Ravensdale-road by Messrs. W. H. T. Kelland & Sons, contractors, of Stamford Hill. Messrs. George Baines & Son, F.R.I.B.A., architects, of Westminster.

Streatham.—Over 900 houses are to be built on the estates in Streatham Vale, S.W., which have been purchased by Messrs. R. H. Miller & Son, Ltd., 2, Ravenstone-street, Balham, S.W.12. Five hundred will be of the subsidy type, designed by the firm's staff.

Tooting.—It is proposed to build a new church of St. Augustine on a site in Garratt-lane, Tooting, S.W.17, at a cost of about £20,000. Mr. H. Burke Downing, F.R.I.B.A., architect, 12, Little College-street, Westminster, S.W.

Twickenham.—Messrs. F. & H. F. Higgs, Ltd., Hinton-road, Herne Hill, S.E., have started upon the conversion of York House, Twickenham, into municipal offices for the U.D.C., at a cost of about £30,000. Messrs. Knott & Collins, architects, Adelphi-terrace House, W.C.2. Mr. F. S. Henniker, quantity surveyor, 1-3, Robert-street, W.C.2.

Wallington.—New showrooms and workshops are to be erected on a site at the corner of Woodcote-road and Stanley Park-road, for the Croydon Gas Co., Katherine-street. Messrs. Henry Berry & Son, architects, 33, High-street, Croydon.

Waterloo-road.—It is hoped shortly to make a start upon the extension of the Royal Waterloo Hospital for Children and Women, in Waterloo Bridge-road, S.E.1. The contractors will be Messrs. Holliday & Greenwood, Ltd., Stewarts-road, Battersea, S.W. Messrs. Waring & Nicholson, architects, 38, Parliament-street, S.W.1.

A Correction.

The constructional steelwork and reinforced concrete for the new premises at 74, 76 & 78, Regent-street, and 3, 5 & 7, Air-street, W.1, for Messrs. Callard, Watt & Stewart, and Messrs. Packers, Ltd., is being supplied by Messrs. Young & Co., of 6, Queen Anne's-gate, S.W., and not by the firm mentioned in last week's *Builder*.

The Institution of Structural Engineers.

On the commencement of his term of office as President of the Institution of Structural Engineers, Sir Charles Ruthen has issued a letter to all engineers and architects practising as structural engineers, in which he calls attention to the question of the membership of the Institution. In the past, admission has been either by examination or, in the case of older candidates of practical experience, on production of evidence of works carried out. The membership of the Institution is now two thousand, and it has been decided by the Council that as sufficient time has been given to all those who wish to enter on the grounds of work carried out, from January 1 next, admission will be by examination only, and a new syllabus is being prepared and will be sent out. In the meantime a final opportunity is to be given to those who have some years of practical experience in the profession, and who wish to make application for direct admission. Such intending candidates should obtain from the Secretary of the Institution a form of application, which should be submitted as early as possible. Candidates admitted under the old system during the concluding months of this year will pay one subscription only to December 31, 1926.

CONTRACTS, COMPETITIONS, &c.

For some contracts still open, but not included in this List, see previous issues. Those with an asterisk advertised in this number. Certain conditions beyond those given in the following information imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any other; that a fair wages clause shall be observed; that no allowance will be made for tenders; and deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in; the name and address at the end is the person from whom the quantities, forms of tender, &c., may be obtained.

(See Competition News, page 418)

Auction Sales, Tenders, etc.

*SEPTEMBER 23.—**Wallington.**—C. E. Clark will sell, without reserve, at North Woodcote Farm Buildings, near Woodcote Estate, Sandy-lane South, Wallington, timber and builder's effects from the demolition of buildings. Auctioneers, Beddington House, Beddington, near Croydon.

PROPOSED NEW BUILDINGS & OTHER WORKS*

In these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works at the time of publication have been actually commenced. Abbreviations: T.C. for Town Council; U.D.C. for Urban District Council; R.D.C. for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; B.C. for Borough Council; P.C. for Parish Council; M.H. for Ministry of Health; M.T. for Ministry of Transport; C.B. for County Borough; B.E. for Board of Education; M.A.B. for Metropolitan Asylums Board; and M.W.B. for Metropolitan Water Board.

ABERTYSTWYTH.—The R.D.C. has adopted a town-planning scheme by Mr. T. Alwyn Lloyd.

ACCRINGTON.—Applications for subsidies have been received and accepted by the T.C. for 68 houses and bungalows, and the Housing Committee are recommending the Council to make application to the M.H. for sanction to borrow a further sum of £10,000.—The Borough Surveyor has prepared plans for 167 houses on the Spring Hill estate.

AIREDALE.—The Ferry Fryston R.D.C. are to acquire a site at Airedale upon which it is proposed to erect new public offices and assembly hall.

BALBRIGGAN.—The Town Commissioners are to make application for a loan of £5,404 for building twelve cottages.

BIRENHEAD.—The Housing Committee are being asked to consider the erection of dwellings for persons disbursed by closing orders, at cheap rentals. Consideration has again been given to the site for the South End police station, and that at the junction of Old Chester-road and Bedford-avenue is again recommended.—The Borough Engineer has prepared plans for the erection of conveniences in Victoria Park.—A loan of £1,470 is being sought for the erection of a motor ambulance garage and additions to the Infectious Diseases Hospital.—The E.C. has accepted the offer of the Birkenhead Institute War Memorial Committee to erect a pavilion as a school war memorial upon the newly acquired playing field in Tranmere.—The B.E. has approved revised plans for the provision of accommodation for manual instruction at St. Hugh's Roman Catholic School.—The Housing Committee have voted the subsidy in respect of 74 houses to be erected by the Hamilton Estates, Ltd., off Bidston-avenue.—The Maternity Hospital at Grange Mount is to be extended.

BLACKPOOL.—It is proposed to erect a new church, on a site that has just been purchased at a cost of £2,000, at Marton. Funds are being raised for the erection, by the Blackpool and Fylde Society for the Blind, of a home for aged blind.

BLUTH.—The Corporation has decided on a scheme to extend the public promenade at an estimated cost of £17,000.—The T.C. decided to submit a scheme to extend the promenade by 300 yds. The new section is estimated to cost £17,000, and application is to be made to the M.H. to raise £17,000 for the work.

BOLTON.—The Tramways Committee have in hand various works in connection with shelters, and plans have been prepared for them in the Engineer's Department.—The M.H. have sanctioned the expenditure of £63,400 in connection with the sewage scheme of the Corporation.—The T.C. have received sanction from the M.H. to their granting the subsidy on a further 250 houses, and the Council approved plans for 59 subsidy houses.—The Wesleyan Methodist Church are proposing alterations and additions to their church at Tonge Moor, and to erect new schools.

BRADFORD.—The Finance Accounts Sub-Committee recommended that application be made to the M.H. for sanction to borrow £30,000 for the purchase of the Clock House Estate at Manningham, which the Corporation have agreed to acquire as a site for the proposed new Bradford Grammar School.—The Electricity Committee are to invite tenders for two new electricity transformer chambers at Norman-lane and Undercliffe.

BRIGG.—The B.G. has recommended an extension scheme for adoption, comprising additional accommodation for 38 beds, new vagrants' room, &c., at an estimated cost of £5,300.

BRISTOL.—The T.C. has approved plans for 106 new houses.—The T.C. are to make application to the M.H. for sanction to borrow the sum of £29,490 to cover the cost of erecting 62 houses.—Provision of a £16,500 crematorium is now being considered by the T.C.

BURNHAM-ON-SEA.—The U.D.C. instructed the Surveyor to prepare plans for the enlarging of the South shelter, for providing conveniences there for men and women, also plans for the provision of a shelter and conveniences on the triangle opposite Sea View-road.

BURY ST. EDMUNDS.—The M.H. has sanctioned loans of £80 for land, &c., and £7,920 for building, also the subsidy of the sixteen houses proposed to be erected near Hollow-road, by the United Sugar Co., and sanction to the necessary loan for £9,600.

BUXTON.—Messrs. F. W. Woolworth & Co., Ltd., of London, have obtained part of premises known as the Shakespeare Hotel, Buxton, and they propose the erection of a large store. Plans are being prepared by their own architectural staff.

CARLISLE.—The T.C. passed schemes included £18,238 for the erection of buildings at the new electricity works, £11,108 for the extension of the electricity mains.—The bridge over the Mill Race is to be reconstructed at a cost of about £1,000.

CHESTERFIELD.—The Bishop of Southwell's Commission recommend the erection of a new church on a site near St. Augustine's and Rythorpe-road, at Brampton.—A new mission hall is to be erected on the Boythorpe estate.—A new church is to be erected at Chester-street, Lower Brampton, also one at the Whittingham Moor estate.—A site is also being acquired at North Wingfield upon which it is proposed to erect a new church and vicarage.

CLEVEDON.—The U.D.C. has decided to erect a pavilion on the Haven site, and have offered a prize of £20 for the best plan submitted, the stipulation being that the total cost should not exceed £3,000 and that the building should be capable of seating 600 persons.

CLONAKENNY.—A Civic Guards station is being erected by the Board of Works.

DARLINGTON.—The T.C. passed plans: T. Rodgers, new hotel, West Auckland-road; J. E. Chilton, four houses, Geneva-road; six houses, Bates-avenue; eight houses, Westlands-road; two houses, Pierremont-gardens; six bungalows, Barnpton-lane; six houses, Stockton-road, Haughton-le-Skerne.

DERBY.—The T.C. has decided upon a programme of 250 concrete and steel houses to be erected during the next twelve months.

DONCASTER.—The U.D.C. of Adwick-le-Street are inviting tenders for the erection of 46 houses in Princess-street, Woodlands. Plans by Mr. G. Gledhill, Council Offices.—The Council approved of a scheme for the erection of a new mortuary, to be erected near the Guildhall, at a cost of £1,125.

DORKING.—The Bradley estate is being developed for housing purposes. The architect is Mr. Robert F. Bargman, A.R.I.B.A., 76, South-street.

DOUGLAS (I.O.M.).—A site is to be obtained for the erection of a mortuary.—The Borough Surveyor has prepared plans for the erection of a destructor.—The Harbour Commissioners are to surface the North and South Quays with reinforced concrete.—The trustees of St. Matthew's Church are to erect a seamen's shelter and club room.

DUBLIN.—Messrs. Murray & Co., of London, has decided to establish a factory for the manufacture of confectionery in the Irish Free State.—Mr. Horace T. O'Rourke, City Architect, has passed the following plans: Mr. P. Corrigan, for 19 houses at Drumcondra.—The Ministry of Local Government has sanctioned the proposal of the Borough Commissioners to raise £500,000 for the provision of houses for the working classes, including a further £30,000 required in connection with the Fairbrothers' Field, Donnelly's Orchard, Marino and Boyne-street areas, the remainder being in respect of the Croydon Park section of the Marino scheme and the Keogh Barracks area.

EASTBOURNE.—The Housing Committee are considering the acquisition of 30 acres at the Crumbles for a housing site. The Borough Engineer is to get tenders for the extension of the motor bus depot. The Sanitary Committee are to report as to the provision of additional conveniences.

FRINTON.—A new church is to be erected providing accommodation for 500 persons. The architect is Sir Charles Nicholson, Bart., 2, New-square, Lincoln's Inn, W.C.1.

GLASGOW.—The Corporation have obtained land at Hollybrook-street, Govanhill, for the erection of a public washhouse. The City Engineer has prepared plans for the extension of the market slaughter-house, at a cost of about £40,000.

GRANTHAM.—The T.C. have decided to apply to the Public Works Loan Board for a loan of £7,750 towards the cost of erecting the new library and museum.

GRAPPENHALL.—Plans have been prepared and work will shortly start upon the sewage scheme for Grappenhall. The portion of the scheme which it is proposed should now go forward was from Common Side Farm along Knutsford-road and Cross-lane and into Pherwall-lane, and would cost £2,900.

GRIMSBY.—The T.C. propose to replace the present Corporation Swing Bridge, over the Alexandra Dock at Corporation-road, with a new bridge, at an estimated cost of £51,000.

HALIFAX (Near).—Mr. G. H. Wilson, of the firm of Smith, Barker & Wilson, Ltd., The Jumbles, Ilkley, near Halifax, are to erect sixty-four houses. Plans and specifications are being prepared by Mr. M. Hall, architect, Halifax.

HARROGATE.—The Corporation has received tenders for the erection of 30 non-parlour type of house on the Bilton Grange estate, and application is to be made for sanction to the borrowing of £16,750 for the work.

HEMSWORTH.—A tender for £25,875, including roads and sewers, has been accepted by the R.D.C. for the building of fifty houses at Great Houghton.—It is also proposed to build an additional 500 houses in the district during the next year.

HENLEY.—The bridge is to be repaired at a cost of £1,350.

HOUGHTON-LE-SPRING.—The U.D.C. has decided to erect 24 houses by contract, and 13 by direct labour.

HOVE.—The T.C. passed plans for A. W. Presland & Co., for seven pairs semi-detached houses, Hogarth-road.—Application is to be made to the M.H. for sanction to borrow the sum of £46,500 for the erection of 96 houses on the Old Shoreham-road estate.

HOVLAND.—The M.H. have sanctioned the erection of a further 72 houses on the Elsecar Estate.

LANCHESTER.—It is proposed to erect a new church at Lancheater. The cost of the new church will amount to about £5,500.

LEEDS.—The M.H. has sanctioned the purchase of a site in Coburg-street for the erection of a Training College of Housecraft. The City Engineer is to prepare amended plans for tenements to be erected for rehousing persons displaced by street improvement schemes. Land at Hunslet is to be acquired for the erection of a branch library.

LONDON (FINCHLEY).—The M.H. held an inquiry into the application of the Finchley Council for the approval of a preliminary statement for development in connection with the Finchley Town-planning Scheme No. 1.

LONGTON.—Funds are being raised for the extensions to the Wesleyan Church and schools, and plans have been prepared by Mr. F. Howarth, architect, Lime-street, Preston.

LYTHAM ST. ANNES.—The T.C. has decided to proceed with a £250,000 sewerage scheme, and several railway bridges in the district are to be widened.

MACCLESFIELD.—Messrs. J. J. Dunkerley & Sons, of Macclesfield, are proposing the erection of a new mill in Oxford-road, and the plans are being prepared by Mr. S. Hudson, Harryfields, Broadbottom, near Manchester.—Messrs. G. N. Heath & Co., Ltd., are proposing the erection of a new mill, offices and warehouse, and the plans are being prepared by Messrs. the exors. of John Clayton, Sunderland-street.

MANCHESTER.—The Housing Committee has decided that of the 600 houses to be erected on the Moston estate, private enterprise shall be invited to build 300. The other 300 will be built by the Corporation by direct labour.—The Improvement and Buildings Committee has approved the purchase of property of the value of £120,000, on the site which is to be occupied by the city's future reference library and other municipal buildings.—A proposal is on foot for the erection of an artificial silk factory, near Manchester.

MARGATE.—The Corporation propose to construct a new sea wall and undercliff promenade at Westbrook at a cost of £36,000.

MERIONETH.—In connection with the bridge at Bont Newydd, the C.C. propose the erection of a new bridge by the side of the present structure, and plans are now being prepared.

MOORTHORPE (S. YORKS.).—The C.C. are considering a proposed scheme for the erection of a new Technical College upon a site in front of the playing fields of the Middle School.

NELSON (LANCS.).—The T.C. have received notification from the M.H. that they are prepared to consider applications for a proposed loan of £30,000 for the purpose of erecting new abattoirs.

NORTH WALES.—The committee of the North Wales Counties Mental Hospital are purchasing 37 acres for hospital purposes.

OMAGH.—The Ministry of Home Affairs is prepared to sanction a loan of £5,000 for the erection of 10 houses by the U.D.C.

OSSETT.—A start is being made with the construction of a new roadway leading from the Leeds-road to the Market-place in accordance with plans and detail prepared by the Borough Surveyor. The macadam is being supplied by several firms, chief of which is O. L. Stiff & Co., Ltd., of Leeds. The estimated cost is £33,662.

OXFORD.—The T.C. recommend that application be made to the M.H. for sanction to a loan of £87 for the erection of public conveniences at Alexandra Courts.

PENISTONE.—The L.N.E.R. Co. are inviting tenders for the erection of a new steel bridge. Plans and specifications have been prepared by the company's engineers at Kings Cross.

PETERBOROUGH.—The provision of a maternity and child welfare centre at Brook-street is under consideration. The Monolithic Concrete Houses, Ltd., are to be invited to quote for the erection of houses which it is proposed to build at Elm-street and Park-street. Repairs are to be carried out at the Wiltshorpe pumping station at an estimated cost of £375.

PORTLUSH.—Lisnavarna House is to be converted into a technical and secondary school, at an estimated cost of £8,000.

PORTSMOUTH.—The Corporation have asked the Health Committee to consider the provision of a public abattoir. Further consideration is to be given to a proposal for reconstructing Copnor-road, work estimated to involve an outlay of £75,000, exclusive of land which should be acquired for widening purposes. A site in Southampton-road has been obtained for the erection of a library for the Cosham district. A tram way shelter is to be erected in Town Hall-square. A loan of £10,500 is to be sought for the Volker-street improvement scheme, of which sum £7,500 is in respect of four blocks of flats to be erected. It has been decided to subsidise 500 more houses. To relieve congestion in slum areas a site at Stamshaw is recommended for purchase and the erection of 72 houses. The Unemployment Grants Committee have sanctioned the scheme for repairs at the Eastney Esplanade. Tenders are to be invited for repairs to the pier head recently damaged by storm.

PRESTON.—Funds are being raised in connection with the proposed new Sunday school for the Per wortham Wesleyan Church.

RAWTESTALL.—Subject to the approval of the M.H. the T.C. has accepted tenders for 66 houses and bungalows on the Oakley and New Inn estates. The prices are as follows: Bungalow type, £599 19s. 9d.; three bedroom non-parlour type, £662 15s. 9d.; and three bedroom and parlour type, £684 15s. each.

RIFON.—The Committee of the Cottage Hospital is raising funds for the extension of the hospital by the addition of a new block. The estimated cost of the work being £5,600.

SHEFFIELD.—The Libraries Committee are considering the advisability of erecting a library at Woodhouse. The E.C. has acquired land for the enlargement of the Shiregreen elementary school. The Watch Committee urge the Corporation to proceed without delay with the scheme for the erection of a fire station at West Bar.—The T.C. have passed plans for 12 houses, Dobcroft-road for M. J. Gleeson, Ltd.—The Housing and Estates Committee has decided to invite tenders for the erection of 12 houses at Hundsfoot. Plans by the City Architect, Mr. F. E. P. Edwards.

* See also our List of Contracts, Competitions, &c.

ETHEWICK.—The T.C. are about to lay out the
ing fields at a cost of £23,000, and convert the
-logged valley into a fine sports centre.

UTHERN-ON-SLA.—The M.H. have held an inquiry
the application of the T.C. for sanction to a loan
£1,000 for the extension of the public library.

RELEY.—"Ashfields," which comprises 6½ acres
and various buildings, has been acquired by
West Salford Labour Party, which is eventually
convert the buildings into a hall, capable of holding
2,000 people.

OUT, ELSMALL.—The Education Committee have
ted a piece of land near Moorhorpe police station
the building of a new technical school.—The Parish
ells of South Elmsall and South Kirkby have
ased a piece of land adjacent to the Moorhorpe
station for the erection of a joint fire station.

EVENAGE.—The U.D.C. passed plans for a sub-
on in London-road, for the Electric Light and
Co.

OCKSBRIDGE.—The Miners' Welfare Committee
made a grant of £2,500 towards a new swimming
Mr. Wishart, Swansea, is the architect.

OCKTON.—The M.H. held an inquiry into the
osals for development in connection with the
-planning scheme of the North Tees Joint Town
ing Committee, which comprises the Borough
ockton, Billingham Urban District, and part of
Stockton Rural Area.

RETTFORD.—The U.D.C. resolved that the complete
for the provision of an open-air school at Long-
Park be forwarded to the M.E. for approval, and
application be made to the M.H. for sanction to the
esary loan to defray the cost, the estimated cost
£8,470.—Tenders are being invited for exterior
vating of 210 houses.—Plans passed: Eighteen
es, Byron-road and Shirley-avenue, for G. H.
n & Son; 20 houses, Ryebank and Woodstock-
for Mr. Whitelegg; sub-station, off Warwick-
South, for the Council.

NDERLAND.—The Corporation Parks Committee
prepared a scheme for the construction of a retain-
wall against the cliffs at Roker, at an estimated
of approximately £18,000.

TANSEA.—The Finance Committee has approved
a application being made to the M.H. for sanction
orrow £10,000 for the erection of a further 100
houses.

INTON.—The T.C. passed plans: E. W. Beard,
houses, Ipswich-street and Ferndale-road; A. J.
rne, 11 houses and 3 bungalows, Wootton Bassett-
2 houses, Ferndale-road, 4 semi-detached houses,
enhau-road, 3 houses, Westmoreland-road.

VISTOKE.—The R.D.C. are to build 100 houses in
district.

ORTON.—The plans for the proposed new school
St. John's Mission, Little Thornton, have been
by the U.D.C.

NSCOE.—Public swimming baths are proposed
ected on the site of the present Council Offices
the Miners' Welfare Fund.

PPERARY.—Messrs. Foley & O'Sullivan, architects,
n. have submitted to the South Tipperary
d of Health the estimate for contemplated work
constructing Tipperary Workhouse into a County
e, which will cost about £13,263.

QUAY.—Plans have been passed for the erection
houses on the Westhill estate, for the Corporation.
application is to be made to the M.H. for sanction
orrow the sum of £11,100 to cover the cost of the

URO.—The City Surveyor has been instructed to
are plans for 33 houses for erection at the Hendra

KEFIELD.—The Corporation have decided to erect
ouses on the Portobello estate. Inquiries are
made for a site at Lupset for an elementary school.
ations are proceeding for a site for a hospital
ity Engineer is to prepare revised plans for exten-
at the maternity home.

RRINGTON.—The Warrington Golf Club are pro-
g the erection of a new golf house, and the
ect who is preparing the plans is Mr. A. War-
n, of Gold-street.

ST RI ING.—The West Riding E.C. are inviting
s for the heating of the Mexborough Technical
premises. Plans have been prepared at the
ational Department, County Hall, Wakefield.

YMOUTH.—The Ministry of Health have sanc-
a loan of £675 for the construction of conveni-
t Nothe Walk. Further efforts are to be made
ain a grant from the M.T. for the construction of
n bridge across the harbour.—The T.C. have
ed a tender of £23,297 for the erection of
our parlour-type houses on the Westham
estate.

STON.—Plans have been passed by the U.D.C.
houses on proposed new roads off Aylestone-lane,
ans for the new roads to be constructed have
een approved.

LINGTON (CO. DURHAM).—The U.D.C. has
ed plans for the erection of a village hall at
bank, under the Miners' Welfare scheme.

SAL.—The R.D.C. have made application to
£123,776 to promote a scheme for sewerage
wage disposal in the parishes of Frankby,
y, Bidston-cum-Ford, Moreton, Sanghal Massie,
pton.

HAM.—The U.D.C. has instructed the Surveyor
are plans for alterations to the Council offices
tenders be advertised for. The estimated cost

BWELL.—The Jump Miners' Welfare are pro-
the erection of a pavilion, in Cemetery-road.
The architect for the scheme, which is to cost
is Mr. H. Everatt, of 93, Wombwell-lane.

ING.—A serious fire, resulting in the complete
tion of one factory, extensive damage to two
and badly damaging two cottages, occurred at
houses of the National Bituminous Products,
67B, Caversham-road. The damage is esti-
at £10,000.

BIRMINGHAM BUILDING EXHIBITION.

WE published in our last issue a general survey
of the Building Exhibition which is now being
held in Birmingham. We give below some
further notices of exhibits.

MESSRS. GOODMAN & Co., builders' merchants,
New Wharf, Selly Oak, Birmingham, have two
stands devoted to the exhibition of their
materials; an interesting feature is a display
of raw materials as quarried, and the various
stages of their manufacture into the finished
"Blue Circle" Portland Cement supplied by
the Cement Marketing Co. The firm are also
the local agents for the Adamite Co., Ltd., and
show a variety of textural finishes for stucco
work in Atlas White Portland cement. The
pleasing texture and colour of "Battledown"
roofing tiles can be seen to advantage on the
stand; samples of whitening and lime, concrete
floor finishes, waterproofing concrete compounds,
&c., are also on view.

MR. A. COLLIER, 453, Brixton-road, Brixton,
London, S.W. 9, is exhibiting a new invention—
the "Shetack" saw. This possesses advantages
over the ordinary hack saw inasmuch as the
angle at which the blade is held in the frame
enables it to cut through any length or width of
material; with it a hack saw blade can cut
corrugated iron, galvanised iron tanks, asbestos
sheet, &c.

One of the largest stands at the exhibition
is that of the BUDERUS TRADING CO.,
LTD., of 107-109, Upper Thames-street,
E.C.4. This firm specialises in the produc-
tion of high-class fittings, such as baths,
lavatory basins, sinks, central heating
boilers, roofing tiles, flooring blocks, &c., and
at their stand is to be seen a wide range of these
goods, from which the prospective purchaser
can judge the quality for himself. As this con-
cern operates its own ironwork, blast furnaces,
foundries, &c., it will be realised that it is able
to turn out high-class goods at very com-
petitive prices. The white porcelain enamelled
baths and similar goods on show at Birmingham
are particularly noticeable for their excellent
design and workmanship. In our last issue,
we regret that the address of this firm was
given wrongly, and we would take this oppor-
tunity of pointing out that reference to the
cheapness of this firm's products was not
intended to give the impression that they are
not of first-class quality.

TRADE NEWS

Shell-Mex Oil Fuel.

WE have received from Messrs. Shell-Mex,
Ltd., a brochure dealing with modern central
heating, for which they strongly advocate the
use of oil fuel, claiming it to be in every way
more satisfactory than coke. Their technical
staff, in co-operation with oil-burner manu-
facturers and heating engineers, has experi-
mented for three years on a plant which can
be applied to any ordinary type of central-
heating boiler and which is sufficiently simple
and reliable to be left unattended for long
periods without the risk of a breakdown: this
plant they claim to have perfected. An ex-
planation of the working of the plant and its
advantages is given. Owners of central-
heating plants who are contemplating con-
version to oil fuel should apply to Shell-Mex,
Ltd., Shell Corner, Kingsway, W.C.2, for
particulars.

Fosalsil.

WE have received a copy of the latest
brochure dealing with Fosalsil (Moler),
which is claimed by the makers, Messrs. J. H.
Sankey & Son, Ltd., to be a perfect insulating
material. By utilising slabs or bricks of this
material great economies, it is claimed, can
be effected in building. It has been computed
that in some cases as much as 60 to 70 per
cent. heat loss has been prevented by this
means: conversely, for cold storage Fosalsil
keeps heat out and condensation is entirely

absent; which advantages, together with those
of extreme lightness and cheapness, make it
a useful building material.

Parsons' Rubber Stipplers.

WE have received a leaflet from Messrs.
Parsons & Sons, dealing with the patent
rubber stippler for which they have the sole
rights. They claim that the rubber strands
employed in the making of these stipplers
give cleaner and better results than bristles.
They point out that a common defect of the
latter is the breaking off of pieces of the
bristles, which, adhering to the paintwork,
mar the appearance of what might otherwise
be a perfect job. They claim, also, that their
three grades of stippler enable an ordinary
painter to produce a pleasing variety of effects,
examples of which can be seen at the firm's
showrooms at 315-317, Oxford-street, W.1.

Vitaglass.

WE have received from Mr. F. E.
Lamplough, M.A., 47, Bunbury-road, Kings
Norton, Birmingham, copies of leaflets illus-
trating and describing the new Vitaglass, which,
it is claimed, permits, through the inclusion
of certain ingredients not present in ordinary
glass, the passage of the ultra-violet rays to
which the ordinary glass is opaque. Modern
medical research has shown that the health-
giving properties of sunlight are entirely due
to the ultra-violet rays of the sun's spectrum.
Mr. Lamplough, M.A., was formerly a Fellow
of Trinity College, Cambridge, and for some
years Director of Research with Messrs.
Chance Brothers, who manufacture the glass
for him to his formula. It contains a high
proportion of quartz and other extra in-
gredients, and is also somewhat harder than
ordinary glass; the standard make is slightly
diffusing. It is also available with a
special diffusing surface with much greater
indistinctness of vision, for use where strict
privacy is required, such as in the case of
lavatory windows. It is also made as a clear
window glass at a slightly higher price.

Broughton Copper Company.

THE Broughton Copper Company, Ltd.,
have sent us their booklet on special temper
copper tubes for water service. They state
that copper can now be put in at less cost
than lead, and at very little more cost than
iron, besides being superior to both in every
respect. Whilst supplying heavy copper tubes
to customers who prefer to adhere to the old
type of screwed fitting, they have specialised
in light tubes for compression joints. The
majority of their customers prefer the latter
system because it involves a positive metal-to-
metal joint highly resistant to pressure,
eliminates screwing of the tube ends, the use
of solder, red lead, etc., and enables the joint
to be made in less time than a "wiped
joint" in lead or a screwed joint in copper
or iron pipes. The joints can be disconnected
and re-connected quickly and easily, and as
often as required—a big advantage over lead
or iron pipe joints. Broughton Special
Temper Tubes are especially manufactured for
use with compression joints, and their makers
claim that they are as economical and durable
as it is possible to obtain.

The "Wellcome" Photographic Handbook.

WE have received the "Wellcome" 1925
handbook and diary from Messrs. Burroughs,
Wellcome & Co., the world-known suppliers
of photographic apparatus and materials.
This issue contains most complete treatises on
every subject dealing with photography,
together with tables of time, light, etc.: these
latter are supplemented by a patent exposure
calculator. There are also tabulated memo-
randa spaces and a useful diary.

Our readers will be interested to hear that
the firm of Newton & Son, builders and decor-
ators, have been in existence exactly 250 years,
for the whole of which time they have occupied
the same premises at Hitchin.

 George's-square, for the T.C. :—

*T. Roper & Sons, £186 5

SHEFFIELD.—Installation of heating apparatus
 at the Bernard-road depot garage, for the T.C. Mr.
 F. E. P. Edwards, F.R.I.B.A., City Architect :—

*Brightside Foundry & Engineering Co., £745

SHEFFIELD.—Timber store in Queen-road, for
 the T.C. Mr. F. E. P. Edwards, F.R.I.B.A., City
 Architect :—

*Wellerman Bros., Ltd., Sheffield.

SHEFFIELD.—Banking premises at the junction of
 Rockingham-street and The Moor, for Messrs. W.
 Deacons, Ltd. Mr. W. Cecil Jackson, architect,
 Chesterfield :—

*J. Eshelby & Son, Sheffield.

SHEFFIELD.—Memorial Hall, for the Rev. H.
 Holden, Owlerton Vicarage, Forbes-road. Mr. H.
 Webster, architect, St. Marys Chambers, Norfolk-row :—

*G. Longden & Sons, Sheffield.

SHEFFIELD.—New Diphtheria Block at the
 Swallownest Hospital. Mr. J. Haslam, architect,
 Ryton Chambers, Worksop :—

*W. Memmory.

STRETFORD.—Repairs to the stores roof, for the
 U.D.C. :—

*F. E. Gill £257

SWINDON.—For (1) rebuilding portion of chemical
 laboratory at the Victoria-road secondary school and
 technical institution; and (2) extensions and altera-
 tions to cloak-room accommodation at Euclid-street
 School, for the E.C. :—

(1) *Pope Bros.	£653	7	0
(2) *H. & C. Spackman	2,787	8	11

SWINDON.—Repairs and decorations to 112
 houses on the Hurst housing estate, for the T.C. :—

*S. H. Rushen, Swindon, £489 0 10

TAUNTON.—Forty-two houses, for the T.C. :—

*F. & E. Small, Taunton, £18,223
 (Messrs. Tearle & Deacon's tender withdrawn.)

TILBURY.—Erection of further houses, for the
 U.D.C. :—

153 houses in the South Ward—	
*W. E. Walsham, Ltd.	£70,830
110 houses in the South Ward—	
*Brown Bros. (Grays) Ltd.	50,780
68 houses in the North Ward—	
*Henry Boot & Sons (London), Ltd.	35,360

TORQUAY.—Twenty-one houses on the Westhill estate, for the T.C. :—

*R. E. Narracott £10,500
(Subject to M.H. approval.)

UPTON SCUDAMORE.—Alterations to chapel, for Mr. A. T. Willoughby. Mr. Chas. H. Goater, architect. Trowbridge :—

*S. J. Wood.

UXBRIDGE.—Ward block and connecting corridors, and reconstruction of existing nurses' home and addition thereto, containing 36 rooms, at the Union Institution at Hillingdon, for the B.G. Messrs. A. Saxon Snell & Phillips, architects :—

Perry Bros, Ealing £40,444
Y. J. Lovell & Son, Gerrard's Cross .. 36,124
Patman & Fotheringham, London... 35,611
R. Ginn & Son, Hertford 35,497
F. R. Hipperson, London 35,280

THE BUILDER

A JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR.

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

VOL. CXXIX.—No. 4,312

SEPTEMBER 25, 1925.

A PROPAGANDA COMMITTEE?

THE urgent necessity of architectural propaganda is by now so fully recognised in the profession that there is no need to advance further arguments in its favour. At present we all realise that something ought to be done to bring the art into closer relationship with modern life, but we have only hazy ideas of what form action ought to take. In the first place we know that infinitely more attention is drawn to a new play that may run a few weeks or months than to a new cathedral, and that a novel will always take precedence of a building. This is obviously undesirable, but can we do anything to remedy it? Then, again, public architectural functions are always inadequately reported in the lay Press, if, indeed, they are mentioned at all; an instance in point being Mr. Ramsay MacDonald's recent speech at Liverpool which was condensed to nearly nothing in the lay Press.

The lack of books dealing in a popular way with modern architecture is gradually being made good and these are certain to bear fruit in time, but it is astonishing how little effect they have as yet produced upon that section of the public that in other respects we should call educated. Then, again, there is the education problem. Is a man always to be considered completely educated because he has spent three years at a private school, five at a public school, and three or perhaps four at an ancient university, and at the end of these twelve years has never been given one half-hour's instruction in architecture?

Then there exist the local engineer and surveyor, and the speculative builder. When these have a slight acquaintance with architectural principles they can avoid the pitfalls and blatant errors that otherwise are certain to catch them. Their knowledge of design may be insufficient to turn them into architects, but at least they know when and where to go for advice and guidance. Local authorities' surveyors have had no grounding in the principles of lay-out and cottage design through the Government scheme, but surveyors are constantly learning, and we should be deluding ourselves if we supposed that the Addison scheme had produced the permanent effect we should desire among them. The town-planning schemes may effect more.

As regards the speculative builder, his output has noticeably improved in some places, but in others no improvement is visible. Instead of advancing as an organised body, which they are, speculative builders seem to be hardly influenced at all by any general endeavour to improve their architecture. Architects themselves have undoubtedly improved as a body, but those that are properly qualified can as a rule be relied on to produce work of a reasonable standard; this is all to the good, but it is less inspiring when we remember that they have completed considerably less than half the buildings that are erected every year.

There is a general improvement, but it is far too slow, and every bad building that is put up represents a permanent black mark. In order to minimise the number of these black marks architectural propaganda must itself be organised, since nothing can be accomplished without some directing control. We need to fear that organisation is in any way contradictory to the

interests of true art. Richard Wagner's great venture at Bayreuth demanded a great deal of organisation, and in our own day Miss Lilian Bayliss has worked miracles of art propaganda through the organisation of the Old Vic. There are so many ways in which architectural propaganda might be put on an efficient footing that we take the following points almost at random, as ideals that should be aimed at:—

1. That architectural correspondents should occupy a position on the great daily papers such as that at present reserved for the other arts.
2. That architecture should take its place in general education in schools and universities.
3. That a knowledge of architectural elements should form one of the qualifications for surveyors to local authorities.
4. That the speculative builder should be urged to study the architecture of housing—preferably through his own organisation.

We may readily admit that some of the above points may be difficult to put into effect, but they certainly are all desirable, and there exists no authority responsible for taking steps to bring about reforms of this kind. The only criticism that could come from within the ranks of the profession would arise through a confusion between architectural propaganda and architects' propaganda, which is quite a different thing. The difference might be illustrated by considering the speculative builder. There are two ways in which his work might be improved: (a) By self-education through a study of cottage and house design, so that he would know enough to avoid bad mistakes and to build tolerable houses; (b) he might consult or employ an architect. The first alternative might in the long run be the best for architecture, while the second would clearly be the best for architects. Neither of them may be feasible *in toto*, but between them these expedients might bring some relief to our suburbs of to-morrow. If we place architecture first and architects second it may well be necessary to call for some sacrifices on the part of architects, and any confusion between architectural propaganda and personal advertisement would be as harmful to architecture as would be a public impression that architects were forming themselves into a trade union and tying up their art in red tape.

There is at present no one whose business it is to see to reforms of the kind suggested here concerned with the advancement of architecture as a cog in the life of the community, and something in the nature of an official architectural propaganda committee would seem to be necessary. It would act as a kind of "Press Bureau," and see that the daily papers were supplied with information of interest, copies of speeches, papers, &c., from which they could extract what they wanted. It could arrange for courses of lectures, articles, and provide slides and photographs with a view to bringing architecture before the public; it could, in fact, see generally that architecture was not left so completely unrepresented in ordinary life as it is at the present moment. The profession is at last under one supreme control, and this should be the ideal moment for architecture to put herself right with the public, and if architects do not do it no one else can undertake the task.

NOTES.

**Industrial
Agree-
ments.**

UNANIMITY between employers and employed must necessarily be the basis of any industrial agreement affecting a trade throughout the whole of the country. This has been the outstanding lesson of the history of trade unionism, the whole object of which is, in fact, to get improved conditions for the workers by collective bargaining. Sectional agreements have not only invariably failed to be effective, but have generally resulted in embroiling larger areas in disputes brought about by their failure. Facts such as these are patent to all. And yet we find the National Federation of Building Trades Operatives, who do not now represent anything like the whole of the building trade workers, expecting the building trade employers to ratify a national agreement with them alone. It is difficult to understand the attitude of the Federation in expecting the employers to conclude a national wages agreement which does not include such important sections of the operatives as the bricklayers, plasterers, and masons, who seceded from the national body some months ago. Surely the Federation must know that no satisfactory and lasting agreement can be reached before they overcome their own internal dissensions and all branches are again represented by one body? One cannot help wondering whether the present position is being created with a view to forcing the secessionists back into the National Federation; and, if so, whether a policy which may involve the whole building industry in another serious dispute is a justifiable

method of settling what, after all, are the domestic troubles of the operatives.

**Heating
and
Cooling.**

DURING the spell of hot weather last July we came across an interesting experiment in a large London office building. The building in question was fitted with a heating installation on the panel system, which gave all the warmth necessary in the winter, but during the hot spell open windows and fans were not sufficient to keep the occupants cool. In spite of the sweltering weather, one of the staff had enough energy to think over the problem, and conceived the idea of running cold water through the heating installation. This was done, the temperature of the water from the mains being still further lowered by passing it through an ice chamber before it entered the circulation system. The result was quite satisfactory, and on commenting on the comfortable atmosphere we were told that it was entirely due to making use of the heating installation for cooling purposes.

**Words
of
Wisdom.**

It would be well if the wise words of counsel which do occasionally drop from the mouths of speakers could meet with a sympathetic response. For instance, in the address by Mr. Thomas Barron, at the annual Conference of the National Federation of Building Trades Operatives, there were many appearances of reasonable argument, and it is worth noting that he said "if the workers in the building industry believed what they said when they declared that they could run the industry without the employers, they should seek to equip themselves for the task."

**The
Sculptured
Frieze of
East India
House.**

WE illustrate this week some details of the remarkable sculptured frieze of East India House, Regent-street, designed by the late Edwin T. Hall, F.R.I.B.A., and Mr. E. Stanley Hall, F.R.I.B.A., and carried out by Mr. Charles L. J. Doman, A.R.B.S. and Mr. Thomas J. Clapperton, A.R.B.S. Measuring as it does 115 ft. long by 8 ft. in height, it is the largest sculptured work in London, and it was considered too big a task for one sculptor, if the work was to be ready for the completed building. Mr. Doman, therefore, took on the central bay, with two bays to the north and on to the south of the centre, and Mr. Clapperton was responsible for the two outer northern and the three southern bays. The subject of the frieze is the transport of merchandise from the East and West to the Mother Country, typified by the central figure of Britannia with shield and trident. At either ends are ships signifying the distant seas; Western ship at the north end, and Chinese junk at the south. A Chinaman squats on his haunches at the dock side while coolies load the junk with silks and cases of ivories. A dock policeman superintends. In the next panel to the junk two camels are seen taking up their load of carpets from the Orient. Behind them a potter works at his wheel, and a woman with her baby on her hip, walks off with a finished pot on her head. The third panel shows a proud lady of Georgia scorning the working girl at her feet, her own head protected from the sun by a feather fan. An Egyptian woman directs the packing of bales of goods. In the fourth panel an elephant kneels to receive his load of merchandise, while a Mocha

Detail of Sculptured Frieze on East India House, Regent-street, London. (See also p. 453.)

Detail of Sculptured Frieze on East India House.

Indian woman swings by, trousered, and a basket on hip. In the panel next to the Western ship at the north end of the frieze is depicted the making of porcelain. The venerable master examines the finished piece, and the apprentice stands by. The remaining two panels on the north side show a laden cart drawn by two horses; fresh bales of goods are being made ready in the group behind. From over the top of the frieze three spectators in stone watch the procession pass—a girl by herself on the left, and a man and his lass on the right. This was the wish, following a suggestion in a picture of Raphael's; and it is extraordinary what life and animation the fact of these three spectators seems to give to the whole conception of the frieze. Messrs. Doman and Clapperton started their models in April, 1923. By August, 1923, the quarter full-size models were completed. The half full-size models were finished in November, 1923, and all the full-size models in March, 1924. The work was then entrusted to Mr. G. Dalie and his sons at their yard in Shepherd's Bush, and here the whole frieze was chiselled and built up to completion. The finished sculpture was moved to East India House in August, 1924, and the whole frieze was completely erected in 14 days. It contains nearly 100 tons of the best bed of Portland stone.

It will not be without significance that, in the conditions issued for the new College Collegiate Buildings for Mossley-hill, Liverpool, there is no mention of style. The assessor, Mr. Gilbert Scott, evidently thinks best to leave intending competitors to choose their own point, and we feel this is the right view.

A VERY large number of students' drawings are on view at the Institute Galleries this week, indicating the work which has secured exemption for their authors in the Institute Intermediate and Final Examinations. There is a large amount of creditable work, but the Gothic designs are much below the quality we used to see thirty years ago. The following may be mentioned:—London University: Jutland Memorial, by Ph. Pattrey; Dairy Farm, by Guy Morgan; design for First-class lounge on steamship *Franconia*, by T. R. Alabaster, Glasgow; a good classic design for a School of Architecture, by L. C. Farquhar. Architectural Association: Open-air theatre, by Doris H. Lewis; Municipal Market, by L. Sivotkin;

an Hotel in Mayfair, by — Walker; Headland Hotel, Miss Sleight. Liverpool School: Memorial Buildings on an Island, by A. G. Phillips; University School of the Theatre, by H. L. Barton; Faculty of Architecture Building, by Miss Thelma Silcock; Bank and Office Building, by H. Thearle. There are some clever drawings from the Bombay School of Art.

The Leverhulme Sale. THERE seems no reason to doubt that Lord Leverhulme's trustees will find a better result from the sale of his treasures in New York than in London, but it is perhaps a little unfortunate that the change of the sale from London to New York could not have been foreseen earlier; any possible buyers coming over for the sale might even now be crossing the seas, and the sale of catalogues must have been largely influenced by the belief that they described things to be bought in London. The inflation of prices by the competition of wealthy buyers will in few cases survive the test of time.

Rent Strikes. WE notice that certain Labour representatives on the West Ham Board of Guardians are advocating the stoppage of rent allowance from the relief paid by them to the unemployed. The Ministry of Health demurs at the huge total paid in this way, so the landlord is told he must suffer so that other forms of relief may not be curtailed. Why is the landlord always looked upon as the first person to be defrauded, and not the baker or the grocer? Presumably because the houses are already in the possession of the tenants, and to refuse payment for what you are enjoying does not appear to some minds such an unlawful act as to take goods by force.

Detail of Sculptured Frieze on East India House.

GENERAL NEWS

Change of Address.

Mr. W. J. Fitt, L.R.I.B.A., has transferred his office from No. 11, Bolton-street, Piccadilly, to 126, Bishopsgate, E.C.2.

Mr. H. C. Hughes has moved his office to No. 1, Tunwell's-court, Trumpington-street, Cambridge. Telephone as before—Cambridge: 184.

Dissolution of Partnership

The partnership subsisting between Mr. G. A. Boswell, F.R.I.B.A., and Mr. L. R. Guthrie, F.R.I.B.A., at 37, Bruton-street, London, W., has been dissolved by mutual consent as from August 31, 1925.

Manchester Housing Scheme.

The Manchester Town Council are thinking of throwing out a "satellite town" in the direction of Cheshire, instead of building the usual endless suburbs.

Proposed Horticultural Hall.

Lord Lambourne states that a larger hall will be built for the Royal Horticultural Society on the present premises; it will contain 20,000 ft. of exhibition space, and is to be designed by Messrs. Easton & Robertson.

St. Mary Abbot's Hospital.

The Kensington Guardians have received a letter from the Minister of Health sanctioning a scheme (at first turned down owing to the difficulty of finding labour) for the erection of a new nurses' home at St. Mary Abbot's Hospital.

York House, Twickenham.

York House, in Richmond-road, Twickenham, a famous Queen Anne mansion, is being converted into a town hall, three public halls and a swimming bath being provided; the grounds will become a public park.

Ashted Forest Excavations.

Interesting discoveries continue to be made during the work of excavating on the Roman site in Ashted Forest. Articles recently found include tiles showing deer and hounds in relief; pots with stags in relief; and Samian pottery with egg and dart moulding.

New London Cinema.

Mr. F. G. M. Chancellor is collaborating with Mr. Thomas W. Lamb in designing the picture house to be erected on the site of the Empire Theatre in Leicester-square. It is planned on American lines similar to the Capitol Theatre of New York, and will seat 3,500.

Limerick Dock Extensions.

A sum of £150,000 has been guaranteed under the Free State New Trade Loan Act for the extension of the docks at Limerick and the construction of a western entrance. The work is likely to be undertaken by Messrs. Siemens Schuckert.

Proposed Beet Sugar Factories.

Lord Weir, at the first annual meeting of the Anglo-Scottish Beet Sugar Corporation, announced the constitution of a second Anglo-Scottish Beet Sugar Corporation, which will build three new factories—one of them at Cupar, Scotland—within the next twelve months. An expenditure of a million pounds is involved.

Factory and Workshop Act.

We have received a revised draft of the regulations made by the Secretary of State under Section 79 of the Factory and Workshop Act, 1901, in respect of certain building operations, embodying a number of substantial modifications of the original proposals. Copies may be obtained on application to the Factory Dept., Home Office, London, S.W.1.

New Nottingham Power Station.

The first section of the new electric power station of the Nottingham Corporation, which has an installed capacity of 30,000 kilowatts and cost £685,000, was opened recently. The demand for current is so great, however, that

extensions are already in progress which will increase the output to 50,000 kilowatts and the cost to over £1,000,000.

Architects' Estates.

Mr. Alexander Brown, architect, of Aberdeen, who died last April, left personal estate in Great Britain valued at £8,561.

Mr. Charles Wardman Rollinson, of Chesterfield, late of Messrs. Rollinson & Son, architects and surveyors, Chesterfield, left estate of the gross value of £14,016, with net personalty £11,487.

Proposed Nottingham Schemes.

No opposition was forthcoming at the Nottingham Guildhall when the Ministry of Health inquired into the Corporation's application for sanction to the borrowing of £504,000 for the new Exchange. Mr. T. C. Howitt is the architect for the proposed Exchange, which is to be a Portland-stone-concrete-steel building. A £750,000 sewage scheme is soon to be put before the Ministry.

Harrogate's New Pavilion.

The plans for a new pavilion, seating 800 people, to be erected in the Valley Gardens at Harrogate, have been prepared by the Deputy Borough Engineer, Mr. F. H. Clarke, A.R.I.B.A., and provide for a central domed hall, a rostrum, refreshment rooms, &c.; the architecture of the pavilion will be Roman Doric. The building will be carried out in white stone at an estimated cost of £21,000.

Manchester Art Gallery Committee.

The Manchester City Council has handed over Platt Hall, which was threatened with demolition, to the Art Galleries Committee, who will adapt it as a gallery and museum at a cost of £4,500.

The Manchester Art Gallery Committee has accepted, subject to the consent of the City Council, a collection of *objets d'art* from Mr. C. L. Rutherson, of Bradford, consisting of 50 oil paintings, including the work of Augustus John and others of the modern school; 400 water-colours and drawings by Max Beerbohm, Muirhead Bone, and others; 40 woodcuts by such modern masters as John Nash, Eric Gill, and Gordon Craig; and bronzes and stone carvings by Epstein, Mestrovic and others.

EXHIBITION.

An exhibition which touches the world of artistic effort at various points is that being arranged in the galleries of the Royal Institute of British Architects to open next Thursday. It will include the world of Mr. Reginald Hallward in pictures, glass design, pottery, needlework, and decorative and pictorial work generally, even to a nursery corner. Mr. Hallward is a refined and sensitive artist of a catholic temperament, which enables him to cover a wide field of artistic production. He is an able craftsman, happily endowed with poetic ideals, and his work appeals to varied sympathies. Mr. Hallward's work is seldom seen in exhibitions because so much work has been done directly for its place in churches and other buildings, and therefore the wide extent of it is little known to the public, who will have the opportunity in this exhibition of studying this work on a representative scale, and of demonstrating the value of craftsmanship where the artist is executant as well as designer. Several owners are lending pictures for the exhibition. The exhibition can be made of much interest and value if an effort were made to get visits of students from the architectural and L.C.C. schools to visit the exhibition. It does seem a pity after so much effort has been expended in getting together exhibitions which involve so much thought and labour, that they should fall short of their most valuable mission. We fear that too many go to exhibitions largely for the pleasure of criticising and discounting their merits; the young amongst us are more generous and more ready to be influenced by work which reveals the right methods of production.

COMPETITION NEWS

New Hospital, South Moor-lane, Hemsworth.

Designs by Messrs. Garside & Pennington, F.R.I.B.A., of Ropergate, Pontefract, have been accepted by the Hemsworth and South Kirk Miners' Welfare Committee for the erection of new hospital on a site adjoining South Moor-lane, Hemsworth. The scheme is to cost £30,000, and is to be proceeded with forthwith.

Portstewart Club Houses.

The Council of the Portstewart Golf Club invite architects to submit plans for two new club houses to be erected at the old and new links respectively. Full particulars may be had on application to the Secretary, Mr. P. Blaikie, Portstewart. No remuneration will be paid except for such designs as the Council may decide to use.

[This competition will doubtless receive the attention of the R.I.B.A.]

Competitions Open.

	Particulars published in "Builder."	Send in designs by
Drammen Bridge (Drammenselven). Premiums: 10,000 Norwegian crms., 8,000, 6,000. Apply Gov. Eng., Drammen.		May 29 .. Oct.
Newcastle Fire and Police Station. Premiums: £500, £300, £100. Mr. P. S. Worthington, F.R.I.B.A., Assessor.		June 12 .. Nov.
Town Hall, &c., Pretoria. Open to architects residing in South Africa or Registered under Architects' Act, of 1909, Transvaal. Assessor to be appointed by R.I.B.A. Premiums: £250, £150, £100.		— .. Nov.
Argentine Institute. Premiums 10,000, 6,000, 4,000, 3,000, 2,000 gold pesos. Apply parties, 35, Old Queen-street, S.W.1		April 24 .. Dec.
New Buildings for Liverpool College, Mossley Hill. Sir Giles Gilbert Scott, R.A., Assessor. Premiums: £500, £300 and £200. Apply to J. H. Lintern, Secretary, Liverpool College, Sefton Park-road, Liverpool.		Aug 7 .. Jan.
Australian War Memorial, Canberra. Open to architects of Australian birth. Apply High Commissioner, Australia House, Strand, London.		Aug. 14 .. Ma.
Plan for construction of Conference Hall, for League of Nations, Geneva. International Competition, Sir John Burnet being British representative on Jury of Assessors. 100,000 Swiss francs to be divided among architects submitting best plans. Programmes will be deposited in due course with R.I.B.A., 9, Conduit-street, where intending competitors should apply. Single copies from Secretary-General, League of Nations, Geneva, on payment of 20 Swiss francs.		Jan. 2 ..

* Competitions when "warned" or voted by R.I.B.A. are started.

Bramber Castle.

Bramber Castle, built in the eleventh century, and now a ruin, was sold recently to Duke of Norfolk for £3,000.

Roman Pottery at Bermondsey.

Specimens of Roman pottery have been found during the excavation of the site of the baths and washhouses at Grange-road, Bermondsey. The chief specimen is a cinerary urn in perfect condition, dating from the later of the Roman occupation.

Obituary.

Mr. Paul Bartlett, the American sculptor, died, after a short illness, at his studio in New York at the age of 59. Mr. Bartlett was the author of the fine equestrian statue of Lafayette which adorns the space between the three main entrances of the Louvre at the end of the Jardins des Tuileries. His equestrian statue of Washington is in the Place d'Jena. Another of his works, a statue of Lafayette, has been unveiled at Metz. His other notable works include a statue of Blackstone in the great Hall of the Law Courts in the Strand.

Details of the Sculptured Frieze of East India House, Regent-street, London. (*See p. 450.*)

THE PRESERVATION OF ST. PAUL'S CATHEDRAL AND OTHER FAMOUS BUILDINGS

By W. A. FORSYTH, F.R.I.B.A.

POPULAR interest in the value of ancient buildings will receive stimulus from Mr. W. Harvey's recent publication, "The Preservation of St. Paul's Cathedral and Other Famous Buildings" * and at the same time it will take a useful place in the scanty literature of English architecture dealing with methods of repair of historic structures. The subject is approached in a bold manner, however, being in effect a treatise upon "The new science of conservation," and appears at an opportune moment when so much preservation of buildings is in the air. The theme is centred upon the one building of St. Paul's Cathedral, with occasional reference to certain others, mainly in a ruinous state. Sound criticism is directed to the doubtful methods now in course of application, and there are valuable chapters on diagnosis, by no means complete, however, followed by an attractive series of suggestions for "scientific" repair.

The "science" consists mainly of the methods adopted in recent years by H.M. Office of Works in determining the causes of failures in certain ancient structures and in the application of repairs, mainly of an engineering kind. The efforts of this Government Department have been largely directed to ruined works, not merely to their superficial condition, but more especially to their state of structural weakness. Much experience has been gained from "progressive experiments," and having unlimited means and an unfettered course, great thoroughness, amounting frequently, as some people think, to extravagance, has resulted; indeed, it is the persistent habit of this authority to reinforce whole structures as well as portions only. Mr. Harvey is well versed in these actual operations, which not only receive approval, but merit, in his view, the title of "science of conservation." Herein lies a great risk.

The first principles laid down by the author are: the conservation of original work; the avoidance of new material disturbing to artistic amenities; and to remedy the structural condition of defective parts "in such a manner as will best serve to unite the whole." These principles are old; the "science" is new, and, unfortunately, untried. The greatest principle of all, however, is not fully expressed in this work—that no two buildings are alike in design or construction, or yet in the nature of their defects. This principle is applicable to repairs, and is fundamental in historic buildings. Conservation is incomplete without this important consideration; indeed, great harm would be wrought if any accepted system of calculated repair became general. Continental efforts give an indication of the results of such procedure, and our own official attempts are now tending in the same direction of unsympathetic uniformity, combined with doubtful durability of modern building practice, mainly of an engineering nature.

Mr. Harvey's treatise is perhaps disproportionate, although its outlook is largely directed to the maintenance by reinforcement of one building. Comparatively little is said of the actual construction or materials at St. Paul's, matters in which the popular reader should be informed. Reference made to certain failures in the conception of the design is unconvincing, being qualified by the fact that the author's conclusions are subject to further investigation. It is not difficult, therefore, to make the reader's flesh creep, but it would have been comforting to all interested in St. Paul's if some reassuring statement had been submitted concerning essential preliminary repair before

any colossal and theoretical scheme of doubtful value were attempted.

All practical builders will agree with Mr. Harvey's dislike of the grouting operations now being carried on; method and material are doubtful. The internal walls and piers of St. Paul's are faced with stone ashlar of varying kinds and sizes, masking a core of very weak and irregular lime-built stone rubble. Unequal settlement in the two materials has resulted, producing immense cumulative weakness in the main supports and arches of the great central feature, and it is in this direction that the first repair is needed without loss of time. The core has little weight-carrying value; its shrinkage from the ashlar facing transfers dangerous stresses to this outer masonry, and no grouting can possibly restore the necessary strength or means of solidifying the whole. Nothing but a replacement of the weak core by a reliable substitute will suffice, and it must be done before any fantastic remedy in reinforcement is considered, and must be carried out with materials the power and permanence of which are both tried and traditional.

"Two of the greatest assets of scientific repair are metallic reinforcement and Portland cement," and they are recommended for use in gigantic efforts at St. Paul's even as the Office of Works has employed them in endeavouring scientifically to maintain many of the finest ruins in this country on a lavish scale.

The author's design for the insertion of a large reinforced concrete cone to pick up the double drum carrying the dome and to distribute the gathered weights over walls, bastions, and vaults, is an exceptionally ingenious idea. It is open to several practical objections, and especially one not touched upon by Mr. Harvey—its durability. This new structural feature, being spherical in plan, requires continuity in its manufacture and subsequent functioning. It is doubtful if homogeneous continuity can be secured in the insertion of so large a feature in so impeded a position and so comparatively unknown a material. If it be attempted, then a risk of acute disturbance to the Cathedral is set up at the most complicated point in its construction, and if this condition of continuity is not secured the feature is valueless.

But why introduce an untried method of building in a monument of this importance? Reinforced concrete is a modern use of steel and cement, an ideal combination in theory, but one which has not stood any reasonable test of time. The common reinforcement, mild steel, is admitted to possess greater tendency to rust than any other metal in ordinary building use. It is claimed that the protective cover of concrete will exclude the varied atmospheric influences which promote corrosion. This cannot be so in any long period of years in circumstances of persistent alternations. In course of time these concrete insertions will require repair.

In the first place, how, it may be asked, is a fractured or contracted concrete beam to be reconstructed in position to retain its strength, and how is the rusted reinforcement to be removed and replaced with new? Again, to what extent will an ancient building, like St. Paul's, or a ruin like Tintern Abbey, be wrecked, first in locating and then in approaching and removing the buried ferro-concrete reinforcement? Architects familiar with the repair of old buildings will know how powerful and destructive is the action of rust expansion upon surrounding masonry. The tendency to rust varies, strangely enough, inversely with the age of the metal. Early Mediæval wrought iron was of great purity, and remains sound in many instances to this

day; but gradually in later times as it deteriorated in quality so the rusting power increased, until to-day the ordinary wrought iron, and much more so the mild steel, whose base properties conducive to rapid corrosion.

It is not necessary to refer to the behaviour of the two main substances constituting ferro-concrete during expansion, contraction, and condensation, or to the lack of flexibility, adaptability, and the like, it be said that this material, which forms the basis of the application of scientific repair, is altogether undesirable in ancient buildings of which, being lime-built, are in various degrees flexible and yielding to climatic other influences.

The question of corrosion of reinforcement does not enter largely into Mr. Harvey's calculations. He recognises it, however, in commending that it be "out of contact with the air." Again, he says that certain masonry "should be reinforced with non-corroding metal" owing to the slight substance of stonework. Thus is this profound conclusion slurred over. It would be a misfortune if the theoretical method of repair should be adopted in St. Paul's Cathedral. It should be remembered in this connection that the Survey of the Fabric has for years been engaged in moving rusted wrought iron and repairing damage thus caused to masonry.

In frequent references to the Office of Works to the ruins of Tintern, Jedburgh, and Abbeys, Mr. Harvey unfolds the "scientific measures." Is it not a misfortune that so untried ferro-concrete should have been inserted in these remains at such great expense? At Tintern Abbey a whole network of immense ferro-concrete beams has been inserted in the tops of the walls. The beams have a protective cover of masonry of comparatively little substance, mainly to hide from view, and they are situated in the thickness of the walls subject to greatest climatic exposure. The alternations of temperature of moisture cannot allow these "scientific agents to remain quiescent in such a situation. Sooner or later, when rust sets in, the shrinking or expanding beams, further repair will be required. Where, then, is the "homogeneity"? The greatest trouble begins in the new repairs, and will bring comparable havoc to the structures.

The walls of Jedburgh Abbey have stood 800 years, badly built as they were, and centuries have remained unroofed and unprotected. Will the rustable reinforcement and other mild steel details of the official endure for half that time? This is a less artificial way of repairing ancient buildings, for we are dealing with monumental maisonnettes. It is surely the safest course to adopt to repair old buildings as far as possible with the same materials of which they were built.

Westminster Hall roof could have been paired in oak, and whereas much original might be lost, both the design and the wonderful conception in carpentry would have been retained. Much of the latter has been placed to accommodate a heavy and costly reinforcement, the durability of which is certain, owing to its inaccessibility for painting and for other protective measures.

Upon other processes of preservation where the "scientific" method is inapplicable Mr. Harvey's treatise is unhappily brief. Repair of jointing in masonry by point methods of replacement of decayed masonry, the removal of buried wrought iron, the natural choice of materials, the repair of masonry, the effect of vibrations and of heat upon old buildings, climatic influences, other matters, have little place in the plan of St. Paul's Cathedral or to the buildings dealt with by the author.

The burden of this book, therefore, is the sale reinforcement; and because the selection of its four materials has a calculated application of this process, untried, yet doubted by experience, is without reservation as the "scientific" of restoring decaying structures.

* By William Harvey. Price 10/6. London: 9, Queen Anne's Gate, Westminster, S.W.1. 1925.

MODERN TOWNPLANNING IN PALESTINE

THE progress of the Jewish re-settlement of Palestine is well illustrated by the application of the most up-to-date methods of town planning. Richard Kaufmann (the town-planning expert employed by the Zionist Organisation, Palestine Land Development Co., and other organisations) was in England recently to confer with Prof. Abercrombie and other authorities here, and while in London gave an account of his work.

Mr. Kaufmann said that the rapidity with which new Jewish settlements were being founded, both in urban and agricultural districts of Palestine, made the question of town planning a matter of urgent necessity, both from the aesthetic and economic points of view. The nature of the country made the work technically of some difficulty, but considerable success had been achieved in adapting the layout of roads and avenues to local contours. He illustrated this by examples of new suburbs constructed in the environs of Jerusalem and other places, where advantage was taken of every feature of the surroundings to combine beauty and utility.

Palestine is the first country in the world where the principles of townplanning have been successfully applied to agricultural settlements. Mr. Kaufmann showed two examples of work in this direction. The co-operative colony of Nahalal in the valley of Jezreel is situated on an oval hill, the summit of which has been used for the communal buildings which dominate the settlement. The hill is encircled by a road, from which the approach roads branch off. In the centre space of the circle are the houses and gardens of the non-resident members of the colony, the schoolmaster's house, shoemaker, &c. In the outer circle are the homesteads and holdings of the farming families, all equidistant from the communal utility buildings. The cereal lands radiate from the flatter areas at the foot of the hill.

A different arrangement has been adopted in the case of the other settlement, known as Tiberias, a colony of orthodox Jews, on a similar site near the lake of Tiberias. Here, for religious and æsthetic reasons, the synagogue and the people's hall are placed at one end of the hill overlooking the lake, while the utility buildings (such as the granary), are again placed in the rear. Careful planning has been applied to

the courtyard of each farm, regard having been paid to the prevailing winds, &c.

Mr. Kaufmann's most ambitious design relates to a projected town at the junction of the main roads and railways between Jerusalem and Syria and Haifa and Damascus. Special attention has been paid to the location of the industrial, commercial, and residential districts, clever use having been made of park belts, while the sunken railway will cause the minimum interference with traffic. Mr. Kaufmann stated that there was a real appreciation in Palestine of the benefits of town-planning and every new scheme showed improvements.

CORRESPONDENCE

[While we are glad to publish letters on professional and other matters of interest to our readers, it must be understood that we do not necessarily endorse the remarks of correspondents, who will oblige us if they will express their views as briefly as possible.]

The Raffles Davison Volume.

SIR,—I was pleased to read the suggestion that a volume recording the drawings of Mr. Raffles Davison should be published. As a reader of your journal for many years, and as an ardent admirer of the work of Raffles Davison for 25 years, I trust the scheme will be supported to the extent of publication. Should this take place, please be good enough to record my name as a subscriber.

Sydney.

B. J. WATERHOUSE.

The Mock-Auctioneer.

SIR,—May I request the hospitality of your columns to warn the public against the wiles of the mock-auctioneer? During the past few months the numbers of these pests have increased out of all reckoning. At the same time, only a very few have been the subject of criminal prosecution.

On Saturday, during the course of a walk eastwards from Piccadilly-circus, I came across no less than seven "mock-auction" rooms in full swing. Their methods did not differ to any extent. First, a few flashy-looking "gold," "silver," or china-ware articles were pressed upon the curious ones who had drifted in. Then, actively assisted by friends in the audience, the bidding for other junk was forced up, concluding with the sale to half-willing, more than half-muddled, purchasers of similar trash at extortionate prices.

As has been already intimated, my Society are sparing no pains to obtain the co-operation

of all bodies interested—property owners, tenants' protection associations, goldsmiths, silversmiths, furniture makers—in order that a Bill may be presented to Parliament, and an effectual stopper placed upon a nuisance that has been suffered to continue far too long. We have already met with a considerable measure of success, and trust to be in a position to go forward with such a measure next session.

JOHN STEVENSON,
General Secretary,
The Incorporated Society of Auctioneers
and Landed Property Agents.

The Freemasons' Million Memorial Scheme.

SIR,—Surely the imagination of all Masons must be deeply stirred by the projected memorial, the scale of its conception, and, not least, the warmth of response. Whilst the appeal is still maturing, and before the project is too far advanced for the incorporation of this thought, I suggest to those responsible for its further development that it would be well to provide for a Masonic Memorial of a treatment firmly rooted in the spirit, symbolism and craft of Masonry, and that a mode of construction should be adopted which employs the materials and methods of the old master builders. Let us for this purpose rely upon masonry—rough hewn, if need be—built to endure, of granite, and above all, do not let us compromise with substitutes and imitations.

ARTHUR E. COLLINS,
Past President,
Institution Municipal and County Engineers.

Lowest Tender Not Accepted.

SIR—We regret to find a growing tendency among church councils, &c., not to accept the lowest tender in private competitions, but to choose their own man. Is there any way of checking this manœuvre, which cuts at the root of bona-fide tendering? We should be glad to know if any brother builders are suffering from this practice.

"A LONDON FIRM."

Heal's Building.

SIR,—I was very pleased to notice in the article by Mr. William W. Wood, A.R.I.B.A. (September 11th), that Heal's shop in Tottenham Court-road is praised as a beautiful building. There are few other buildings of this standard in London's streets.

TERENCE LANE.

Bird's-eye view of the Lay-out of the village of Nahalal, Palestine.

MR. RICHARD KAUFMANN, Architect.

THE BIRMINGHAM CIVIC SOCIETY'S REPORT

We have received the annual report for 1924-25 of the Birmingham Civic Society, a society of citizens of that town "who see the necessity for stimulating a wider concern for the beauty of their city." The importance of the work of this body, from an æsthetic point of view, cannot be over-estimated; its general aims are as follows:—(1) To stimulate historical interest in the city, and to this end to preserve all buildings and monuments of historical worth; (2) to preserve all objects of beauty, and to maintain a vigilant opposition to all acts of vandalism; (3) to promote a sense of beauty, and to stimulate civic pride in the domestic and civic life of the citizens, by urging the adoption of the highest standards of architecture for domestic buildings, offices, warehouses, factories, etc.; (4) to work for a more beautiful city, by assisting with advice any scheme or works controlled by public bodies, ranging from town planning to designs for parks, bridges, fountains, memorials, etc.; (5) in addition to influencing the work of others, to select suitable projects to be carried out by the Society itself.

A general meeting of the members of the Society was held in the City Council Chambers on June 29 to receive the annual report. The Right Hon. the Lord Mayor (Alderman

Percival Bower, J.P.) presided, and the Earl of Crawford (Chairman of the Royal Advisory Art Commission) gave an address. The Gold Medal of the Society, awarded annually for exceptional services towards the increase of amenity in Birmingham, was presented to Alderman G. Cadbury, junr.

The development of the Park plans referred to in the previous year's report has proceeded during the current year. The entrance to the new park at Yardley is an example of this branch of the Society's activities; one can see by a glance at the illustration how eminently suitable is the general arrangement.

The New Terrace Wall and Steps, Aston Hall.

Another similar work being executed by the Society, in co-operation with the City Park Department, is the developing of the grounds at Aston Hall, in order to bring them into closer relation with the mansion itself, and by doing so, to provide it with a setting worthy of its historical and architectural importance. Heretofore this has been done can be seen by looking at the illustrations reproduced from the Report.

The first portion of the new gardens to be constructed was that in the east forecourt at the central avenue extending to the east boundary. The avenue has been converted from gravel to grass; and when the accompanying view was taken, the focal point at its eastern extremity was about to be developed, with the great Warwick vase from the south port of the Hall as a central feature. At the point where the avenue reaches the forecourt, the new stone terrace and steps designed and given by the Civic Society have been completed.

The box garden in the forecourt is remarkably successful in its first effect, but it is readily be understood that the precise cutting and shaping of the fully established plants essential to perfection in topiary work of this character. Several important accessories yet in place will add sensibly to the general effect. Attention is drawn to the unusual dimensions of the centre bed, and to the fact that only flowers known in the seventeenth century are to be planted there.

The plan of the bowling green is part of the working drawings prepared for the garden west of the Hall; the work itself is still in its initial stages. Much of the levelling has been done; the bowling green and Italian Garden have been grassed, and the shaped holly hedges about the latter has been planted. It is hoped to complete the greater part of this section of the work during the present year.

This for the garden planning. The President goes on to say that "as the new garden develops, the need for a change in the present arrangement and use of the Hall itself become apparent." A letter to the Chairman of the Art Gallery Committee, indicating the views of the Society, is reproduced; the suggestions put forward include the removal of some modern out-buildings which back the north wall of the forecourt, and the replacement by less crudely coloured glass that in the end bay of the galleries. The Director of the Art Gallery intends to put these ideas into effect.

Other activities of the Society include the preservation of old houses. The old Inn at Deritend, for example, a fine timbered house, probably the oldest in the town, was recently threatened with demolition after sale. The Society proposed to save it from this fate, but compromised by obtaining a written assurance from the purchaser that it was in no danger.

The membership is now 330, and is steadily growing. The Society is confident that the work were more widely known it would still further support; the annual subscription is purely nominal. Those interested should write to the Secretary, at 37, Bennett Street, for particulars, and enclose 1s. 6d. for the year's report.

Southampton Harbour Board's New Offices.

The new offices of the Southampton Harbour Board, which were recently opened by Earl Jellicoe, take the place of a previous structure erected in 1885. Numerous schemes for a new building had been prepared during the last few years aiming at the better housing of the Board, but for one reason or another they never materialised, and remained in abeyance till November, 1922. It was then resolved to re-open the matter, and the Board's engineer and architect (Mr. E. Cooper Poole) prepared plans which were finally approved.

The new offices are built partly upon the site of the old premises, a large portion of which they incorporate. The external dominating feature is a Doric central colonnade pediment and tower. The entrance hall is carried out in oak and is square in shape, one side being devoted to a counter, over which the business with the general staff is conducted. A corridor which leads off from the left hand of the entrance hall gives access to the wharfinger's office, and the engineer's quarters, which include a private office, drawing office, plan rooms, &c. These have all been carried out in oak. A similar corridor on the right hand side of the entrance hall leads to a grand staircase of oak, elaborately carved.

The clerk's room, which is also entered from this corridor, is panelled in oak. Adjoining this are the accountants' office, and the Harbour Master's office. The clerks' apartments are light and roomy, and the accountants' quarters are furnished in mahogany.

The largest room on the ground floor is the general office, which is designed especially for the accommodation of the staff.

On the first floor the principal offices are found. These comprise the board room, committee room, chairman's room, lobby and cloak room. The committee room, which is noteworthy for its five massive windows and panelled walls, has been furnished throughout in oak, the accommodation being sufficient to meet the needs of any of the Board's many committees. The room overlooks the huge sixty-thousand-ton floating dock and the Town Quay, the latter of which is the Board's property. Adjoining it is the chairman's private room, furnished and panelled in mahogany.

A circular columned and domed lobby leads from the committee room to the board room. Here is also a balcony over the entrance. A light well for the entrance hall below is another notable feature, the inside of the circular aperture being noteworthy for some carved panels of nautical interest. The dome and columns of this lobby are of the Ionic order. On the other side of the lobby access is provided to the board room, which has mahogany panelling and twelve mahogany columns of the Ionic order, with copper bases and caps. They are formed in groups of three in each of the four corners of the room.

The contractors were Messrs. Playfair & Toole, Southampton, for the foundations; Mr. H. Cawte, Southampton, for the superstructure. The following were sub-contractors: Artificial stonework, Messrs. Stuarts Granolithic Stone Co., London; hardwood joinery, Messrs. Elliott & Sons, Reading; heating and ventilating, Messrs. G. N. Haden & Sons, Trowbridge; fibrous plaster work, Messrs. H. E. Gaze, Ltd., London; metal work, Messrs. Crittall, Braintree; steelwork, Messrs. E. C. & J. Keay, Ltd., Dalston; "Tilas" floor covering, Messrs. Scott, Somerville & Co., Southampton; electric lighting, Messrs. F. W. Cook & Co., Southampton; clocks by the Synchronone Electric Clock Co., London; complete furnishings by Messrs. Shepherd & Hedger, Southampton; carving by Mr. L. F. Rosslyn, R.B.S., South Kensington.

Tetton House, Kingston, Somerset.

This house, which stands on the beautiful southerly slope of the Quantock Hills, appears originally to have been built about 130 years ago. Since its building, various straggling additions have been made to it and several of the internal walls on the ground floor have been removed in order to enlarge the principal rooms. The present alterations comprise the addition of a smoking room and completely new accommodation for the owner and his family, consisting of two private sitting rooms, bedroom suite and nurseries. All the offices, except the kitchen block, had also to be rebuilt, and the opportunity was taken, therefore, of making these works a complete remodelling of the whole scheme. The convenience of service and the desirability of being able on occasion to use the new private rooms without opening the rest of the house dictated that the plan should be formed round an enclosed court. The west front is entirely new, and the south front owes to the existing building nothing but the general ordonnance and proportions of the openings. The irregular levels of the ground have caused considerable difficulty in planning.

The walls are covered with cement discoloured to a bright apricot colour to match what old work remains. The dressings are of artificial stone painted white. The domical roofs to the bay windows are of copper, and the roof slopes where visible are covered with mottled purple and green slates from the West Country. Mr. H. P. Goodhart-Rendel, F.R.I.B.A., is the architect.

Memorial Hall, London University.

This perspective view shows the reconstruction of the Memorial Hall, formerly a church building in Gordon-square, which was designed by Professor Donaldson. It is proposed to install an organ and build a gallery, and to embellish the interior as part of the War Memorial to

those Fellows and Members of the College fell during the Great War. The architects Messrs. Richardson & Gill, F.R.I.B.A.

New House, Wolsey-road, Moor Park, Herts.

This house, which is now being erected in Wolsey-road, Moor Park, is situated on a falling rapidly from the road and advantage has been taken of this fact and an endeavour to produce a house of a long, low, farm-type. Externally, the house is treated roughly-trowelled "smooth cast," the main feature to the front being in Dutch bricks oak half-timbering over, adzed and left in natural state. The roofs are covered with sand-faced tiles. The windows are star iron casements throughout. The accommodation comprises drawing-room, dining-room, kitchen, garage and offices on the ground and five bedrooms, bathroom, &c., on the floor. Messrs. D. G. Somerville & Co., Ltd. the contractors, and Mr. Gerald W. F.R.I.B.A., is the architect.

Southway House, Southway, Hampstead.

The principal materials used in this are hand-made red facing bricks, hand-laid red tiles to roof, a delf faience surround the doorway, wrought-iron and stone to balcony, and stone and brick pavings. The general contractors were Messrs. Lister & Co. (Builders), Ltd., and the sub-contractors as follows: Hot and cold water and heating installation, Messrs. The Air Vent Heating Co.; facing bricks, Messrs. Thomas Law & Co.; roof tiling, Messrs. Roberts, Adair & Co.; marble to fireplaces, Mr. H. C. T. faience surround to front door and tile fireplaces, Messrs. A. Bell & Co., Ltd.; p.g. flooring to hall and drawing room, Mr. J. Ebner; garden, Messrs. The Horticultural Supply. The architects are Messrs. William Edward Hunt, F.R.I.B.A.

A Bungalow near Halstead, Essex.

Planned as a roadside house in a lane, the house has all windows save offices to the east and west. The accommodation comprises living rooms, four bedrooms and offices. The house is planned as three self-contained groups of small hall. Mr. P. D. Hepworth, F.R.I.B.A., is the architect.

Little Paddocks, Sunninghill.

This illustration shows some exterior of a country house built in the late eighteenth century. The additions have been carried out to harmonise with the existing features. The contractors were Messrs. W. H. Lordon & Co., Upper Tooting, S.W., and the architect Messrs. Richardson & Gill, F.R.I.B.A.

LEGAL SECTION

NOTES ON CURRENT CASES

Buildings in "Streets."

IN our issue August 21 we considered a case which turned upon section 3 of the Public Health (Building in Streets) Act, 1888, *Attorney-General v. Laird*, and in the current Law Reports another case is reported which raised a different point under that Act, (*Attorney-General v. Denby*, 1925, 1 Ch. 596). The section is as follows: "That it shall not be lawful in any urban district, without the written consent of the urban authority, to erect or bring forward any house or building in any street or any part of such house or building beyond the front main wall of the house on either side thereof in the same street. . . ."

In *Laird's* case the two points raised were (1) whether the two buildings in question were in the "same street," which incidentally involved finding whether the part of the roadway in which the building had been advanced was a "street" within the meaning of the Act; and (2) whether, if the two buildings were in the same street, their relative positions were such that the words "the front main wall of the house on either side" could apply.

In *Attorney-General v. Denby*, the action was brought by the Attorney-General at the relation of two ratepayers, owners of adjoining properties, for an injunction and mandatory order based on two grounds: (1) on the ground that there had been a breach of section 3, the building in question having been advanced beyond the front main walls of the two buildings on one side of it without due consent of the urban authority; and (2) that this building contravened a by-law as to ventilation and air-space.

The facts, shortly stated, were as follows: On the sea-front at Lyme Regis there is a parade facing the sea, and at the portion of this parade in question there are houses which form a row.

The house of one of the relators was at the west end of the houses forming this row, facing the sea, but set back 10 ft. from the parade. The house of the other relator adjoined this house to the east. Immediately to the west of the house of the first relator was a vacant site which had been purchased by the defendant in September, 1923, with the view of erecting a hotel upon it. The site ran back from the parade to a depth of 50 ft., but the land in its natural state rises abruptly at a slope of about 40 degrees. The site next to the first relator's house had been excavated to the level of the parade some 40 ft. back, and the higher land to the north was supported by two curved retaining walls with their concavities to the south. A public park bounded the site to the north on the higher ground and also was the boundary to the west, but to the west of the site and between the site and the public park was a piece of hilly ground which the defendant had undertaken to use as a private garden.

The plans for the hotel prepared by the Borough Surveyor showed the hotel with about 60 ft. frontage set back 2 ft. from the parade, and therefore about 8 ft. in advance of the front main wall of the house adjoining. The hotel, as shown, went back to a depth of about 28 ft., but behind this was an annexe up to the second floor, containing a heating chamber, bathrooms and water closets. This annexe was 13 ft. wide and went back 10 ft. close to the retaining wall. The height of the hotel to the roof from the bottom of the excavation was 34 ft., and the bottom of the roof was about level with the top of the above-mentioned retaining walls, beyond which the ground sloped upwards to the public park.

The plans did not show the position of the buildings immediately adjoining the proposed hotel, as required by by-law 45, so as to indi-

cate any infraction of section 3 would be involved, but in other respects they were complete, showing clearly (*inter alia*) the air-space proposed to be left, and the building committee, who were well acquainted with the site, had passed the plans on December 10, 1923, and stamped them as approved.

On this approval the building was commenced December 16, 1923.

On March 29, 1924, the first relator, who on March 11 had objected that the hotel would interfere with the light and air to his house, raised the question as to the infringements of section 3 and by-law 7, but offered to withdraw his objections if the corner of the hotel were cut off so as to prevent interference with his view from the house, but the building had proceeded so far that this course was considered impracticable.

It was only on May 12, 1924, and after these points had been raised, that the Corporation gave written consent to the building being erected beyond the front main wall of the first relator's house, and they added to the consent a statement that this had nothing whatever to do with any action of the Building Committee. On May 14 the fiat of the Attorney-General was applied for, and it was granted May 24, and the action commenced June 2.

Before proceeding to the consideration of the case it is necessary to say a few words about the by-laws. The Corporation had on March 12, 1923, in pursuance of section 157 of the Public Health Act, 1875, adopted certain by-laws which were allowed by the Minister of Health on May 9

By-law 7, the one in question, provided that "every person who shall erect a new domestic building intended to be used wholly or partly for human habitation shall provide in the rear of such building an open space exclusively belonging to such building and of an aggregate extent of not less than 150 sq. ft. Such open space to extend throughout the entire width of the building, and the distance across such open space from the line of the rearmost wall of the building to the boundary immediately in the rear of the site to be not less than 15 ft. This distance was to vary, however, according to the height of the building, increasing as the height increased. It was also provided that such open space, for the said distance at least, should be free from any erection thereon above the level of the ground, except a water-closet, earth-closet, and an ashpit constructed in accordance with the by-laws. It was also provided: "In any case where by reason of the exceptional shape of the site of such building the minimum distance across the open space required by this by-law cannot be obtained throughout the entire width of such building, it shall suffice if the mean distance across such open space be not less than the minimum distance so required." We will take the point as to section 3 of the Public Health (Building in Streets) Act first. It was argued for the relators that the Building Committee had no power to consent to a breach of the Statute, even had the plans shown the breach; but the plans did not show it, and there was therefore no consent, and the Corporation's consent came too late. The statutory offence was committed by the erection of the building without their previous consent.

Southampton Harbour Board Offices: The Lobby, First Floor.

MR. E. COOPER POOLE, Engineer and Architect to the Board.

Southampton Harbour Board Offices: The Staircase.

MR. E. COOPER POOLE, Engineer and Architect to the Board.

For the defendants it was contended that there was no power to remove the building after written notice from the urban authority is a necessary condition of the offence, for section (3) provides: "any person offending against this enactment shall be liable to a penalty not exceeding 40s. on every day during which the offence is continued after written notice in this behalf from the urban authority."

The Court, during the argument on this point, intimated it was prepared to hold that there was an inchoate offence which might have become an actual offence had the Corporation not consented; and in the course of the judgment we find the learned Judge saying: "Of course, I assent to the proposition that in a proper case an injunction might be granted, but it is to be observed that a person is not to be held liable to any penalty unless and until written notice objecting to the building is given to the Corporation."

The main point, however, in the case was whether under the section a person shall not commence "the erection of the building" without the written consent of the urban authority. The cases, *London County Council v. Dross* (1892, W.N. 80), *Regina v. London County Council* (61 J.P. 439), and *Kerr v. St. Leonards-on-Sea Corporation* (6 Ch. Div. 463) were cited in support of this contention; the two latter, however, distinguished by the Court in the present case because there no consent had ever been given, and therefore an offence had been committed, and the third held not relevant to the point at issue. In the second of these two cases, which turned on section 13 of the London Building Act, there is a dictum *ex post facto* consent would not suffice, the Court pointed out that that was but a dictum, as there never was consent, and,

moreover, in that case the building, being erected at less than the prescribed distance from the centre of the roadway of a street, was illegal throughout. The Court held that although the Building Committee had in fact no power to give a written consent and had approved the plans without knowledge of the difference in the main front wall, as the Corporation, as soon as their attention had been called to the dispute, had given a written consent to the house remaining as erected and being completed, there was no breach of the section. As there had been no breach of the section the Court held there was no ground, of course, for granting a mandatory injunction, such an injunction being only granted where there had been a clear and deliberate breach (*Attorney-General v. Wimbledon House Estate Co.* (1904, 2 Ch. 34)).

Before leaving this part of the case we may point out that this esplanade facing the sea and with houses only on one side of it was treated as a "street" within the Act, which would be in accordance with some of the decisions we cited in our article of August 21 last.

The question of the by-laws was a complicated one, and we regret that space compels us in the present article to refer to it only shortly.

The first point dealt with in the judgment was as follows: Section 25 of the Housing Town-Planning Act, 1919, provides that notwithstanding the provisions of any building by-laws (and the Court held by-law 7 to be a "building by-law") a local authority may during a period of three years (afterwards extended to December 31, 1923) consent to the erection of any buildings erected in accordance with regulations made by the Local Government Board, now the Ministry of Health. The Minister of Health did make

such regulations, but they are only concerned with the structure of buildings, not with the question of air-space. The present building complied with those regulations. Subsection (2) enables the local authority to attach to their consent any conditions which they may deem proper as to the situation and sanitary arrangements and protection against fire. Section 40 provides that the expression "building by-laws" includes by-laws made under section 157 of the Public Health Act as amended by any subsequent enactment, and these by-laws were made under that section, which includes amongst other matters the sufficiency of air-space. The Court held that the question of air-space around a building is a matter connected with the building of premises, and that under the above provisions the Corporation had power, so far as the by-laws were concerned, to consent to the erection of this hotel, a power properly delegated to a committee under section 200 of the Public Health Act, 1875.

The Court, however, decided one further point, as it had been contended that the by-law was uncertain and unreasonable, and therefore invalid; and applying the principle laid down in *Kruse v. Johnson* (1898, 2 Q.B. 108), and especially in *Repton School Governors v. Repton Rural Council* (1918, 2 K.B. 133; *The Builder*, November 23, 1917), the Court considered whether the by-law, having regard to the particular circumstances, contained "requirements framed for other purposes and inapplicable to these circumstances," adopting the words of Lord Justice Pickford in the *Repton School* case. The hotel was being erected on the side of a hill with an open park behind on a higher level and the sea in front, and, as the Court intimated, had ample air and ventilation, and there was evidence both of this and the fact that in hilly places such as this it was quite impossible to determine the level of the ground within the by-law, and the Court held the by-law was inapplicable to the circumstances of this case, and clause 4 relating to the height of the building in relation to the open space was so uncertain that no construction could be put upon it in its application to this case, or, as the headnote to the case states, it was unreasonable.

Lack of space compels us to treat very briefly this point as to the by-law, but we may revert to it on another occasion, as well as to one or two other points. Apart, however from the particular facts of this case and the findings thereon, it suggests one or two general observations. It is obvious that the relations in this case resorted to action through the Attorney-General as for the breach of some statute or by-law because the projection complained of was not such as to enable them to bring a private action, that is to say, there was no such interference with light and air coming to their houses as would amount to an actionable nuisance. But the projection of a new building 8 ft. beyond the front main wall of an existing house closely contiguous to it, if not actually adjoining, must seriously affect the amenities of the latter, curtailing its view, and, where the new house is either east or west of it, cutting off the sunshine. In such circumstances the maintenance of a building line appears the only protection adjoining owners can look for, and if a building line were fixed there would be no discretionary power in the local authority to vary it; but under the Public Health (Building in Streets) Act there is a discretionary power in the local authority to consent to a house being brought forward, and thus it appears not to provide adequate protection.

It is often not the site that occasions the difficulty, but the nature of the building it is proposed to erect on that site. For instance, in a confined site, buildings of a like character to existing buildings could be placed in line with them, but a larger building such as an hotel can only be placed upon the site if brought forward. A fixed building line would render this impossible.

HEATING AND VENTILATION

THE OPEN FIRE

WHATEVER may be said, fairly or unfairly, against the open fire, it is doubtful whether we as a nation shall ever lose our affection for it. From mediæval times the English have been commonly accustomed to the sight of burning logs or coal on the open hearth, and this inherited tradition is so firmly rooted that it would be a difficult thing to get rid of, even if that were desired. It is doubtful, however, whether the most ardent advocate of modern, highly scientific "closed-in" apparatus for warming our buildings would willingly agree to the complete extinction of the open fire—he probably has more than a sneaking regard for it himself! It is an institution pleasantly reminiscent of the past, stimulating sentimental thoughts of predecessors who also sat before blazing open fires, watching the flames leap and the smoke curl. To the historically minded it probably provokes intriguing mental pictures of mediæval halls, with burning logs piled against andirons in the middle of the floor; this, of course, only until the smoke and smother forced our castle-inhabiting ancestors (about the twelfth century) to find a better place for the fire, which was naturally the wall, where a direct outlet could be contrived for the smoke. And when this simple change took place the principle of the firegrate as we know it now was definitely established, making possible all the interesting developments that have since occurred, utilitarian and decorative. From that time onwards the fireplace became the chief point of interest of the domestic interior, and succeeding generations of designers and craftsmen vied with each other in lavishing their skill upon its design and decoration.

Up to Tudor and Elizabethan times the fireplace in this country was customarily little more than a wide and deep recess in the wall, containing iron dogs or a movable dog-grate for burning logs of wood; but with the introduction of coal fuel, during the reign of Charles I,

the opening naturally became very much smaller, incidentally providing the architect with more scope for the display of his ability in decorative design, which found expression in magnificent surrounds and overmantels.

The movable dog-grate remained the accepted fuel-container until the eighteenth century, when, however, it was largely superseded by the hob-grate, some extremely fine examples of which were designed by the Brothers Adam. About this time the questions of scientific design and economic fuel consumption began to engage attention, and towards the end of the eighteenth century, after much research, it was discovered that a firegrate, to fulfil its function efficiently, should be small in size, be built of brick or fire-clay, and have splayed sides and a sloping back. Not until late in the nineteenth century, however, were these principles generally adopted in firegrate design. Generally speaking, they prevail to-day, though of recent years much progress has been made in such aspects of the problem as economy in fuel consumption, cleanliness of apparatus in use, smoke abatement, and so forth. An important development is the principle of the ventilating air channel, by means of which the cold air is brought up to the temperature of the fire itself, the super-heated air uniting with the smoke and causing it to burst into flame, the fire thus consuming its own smoke.

Fire-grates are obtainable to-day to conform with almost every style or manner of architectural design, and in a variety of sizes and finishes. In a picturesque setting the wood fire is always appropriate, but to look really well the logs should burn upon dogs on the hearth. For wood block fires, basket grates (best suited to large interiors), are the correct form of container. These grates look well not only in picturesque interiors, but in settings of a more formal kind. For small rooms the ordinary fire-grate, with its tile, glazed briquette, or wood surround, cannot

be improved upon if the fire is to be an open fire. Here, again, a wide variety of styles and finishes is available. One old-established firm produces some excellent "period" fire-grates based upon good models—Elizabethan, Jacobean, Queen Anne, Georgian, Chippendale, Adam, Louis XV and XVI, Empire, &c. This firm specialises in rustless steel fire-grates, which are a veritable boon to the housewife who wishes to conserve her muscular energy.

The barless type of firegrate has firmly established itself in popular favour by reason of its all-round efficiency and cleanliness of use. Several excellent types are obtainable, each having some special point of interest, such being the formation of the bottom, which is "swept up" to the front to facilitate removal of ashes.

In stringent times such as the present it is only natural that the designers of heating apparatus should devote a good deal of attention to the all-important question of economy, not only of fuel consumption, but of fuel employment. Hence, during the past few years we have seen the production of many "plus purpose" firegrates. One such warms a room with its open fire, and by means of a boiler at the back supplies hot water to radiators in different parts of the house. Another, in conjunction with a suitable hot-water radiator installation, will heat an entire house without continuously burning anthracite open fire. Yet another type of double-duty apparatus acts as an open fire and also cooks food and heats water while another, interposed between adjoining rooms, acts as a living-room grate on one side and a scullery cooker on the other.

To describe all the types of firegrates available to the modern architect and builder would occupy more space than we can afford, but enough has been said to show that the open fire is a flourishing institution and is likely to remain so for many years to come.

VENTILATION AND WARMTH

By F. BROADHURST CRAIG.

MUCH has been written and said about central heating and ventilation in this country, and still it is usually referred to as central heating and ventilation. The basic factor of comfort and health would appear to have been—as yet—unrealised. The ideal, surely, is to reproduce inside our buildings atmospheric conditions similar to those which appertain outside when one says, "What a wonderful day!" That, substantially, is the goal. After all, what is desired inside any building (unfortunately one cannot control outside circumstances) is the maximum amount of atmospheric comfort compatible with initial and running cost. The installation of a system of heating by such of the present-day methods which do not properly take into account the importance of ventilation and relative atmospheric conditions, cannot be considered to approach the ideal. If it is all the owner can afford, good enough. A system of open coal or gas-fires; an anthracite stove or two; a few radiators, served from the boiler which supplies hot water for baths and dish-washing, will do; or, if the particular building is of larger size, an independent heating boiler will suffice. This is certainly beyond what has hitherto been achieved in most of our buildings, and one must recognise that considerable progress has been made, though we must also realise that we are still a long way short of perfection. Broadly speak-

ing, ventilation and warmth are inseparable, and if we add a knowledge of the third factor of humidification, we have all that it is humanly possible to produce in this respect.

In dealing with the subject in relation to a private dwelling, one does not need to be unduly concerned about the question of air-conditioning proper. The design of most modern houses is such as to allow of quite adequate ventilation by the natural means of windows and fireplaces. The main objective of central heating in such a building is to ensure the absence of disagreeable draughts from the hall-door and corridors, and to provide warmth in the bedrooms—gas-fires serve the latter purpose well—with two or three hot-water radiators in the hall and passages. English folk generally do not like the close, stuffy atmosphere of American and Continental *confères*; they prefer the natural air movement set up by the opening of windows and doors, and in this connection they appear to conform with the most recent medical thought on the healthy effect of accustoming oneself to draughts of not too cool air currents.

A different condition of affairs arises in regard to larger buildings—offices, theatres, picture houses, assembly halls, and so on. In these cases, particularly, ventilation should be the first consideration, plus warmth. Temperature as indicated by the ordinary dry bulb thermometer is neither here nor there as far as

comfort is concerned, without the other equally important factors of humidity and movement.

It is only within the last few years that attention has been paid to this consideration. In America, where the climatic conditions for more consideration than in this country, very exhaustive investigations have been made in order to ascertain the degree of temperature, relative humidity, and velocity of air movement necessary to produce the maximum of comfort. The results of these tests, conducted under the direction of the leading medical and scientific universities, have been carefully tabulated in the form of a "Comfort Chart," which has made it possible to determine the relative values of the three fundamental factors. The chart has been to revise the previously recognised standards of heating and ventilation.

There is no reason why it should not be possible to reproduce inside our buildings conditions very closely approaching the pleasant natural atmosphere. Actually what happens with badly designed methods is that a room is heated without the addition of moist or fresh air, beyond that which can find its way through the cracks and crevices around doors and windows. In consequence, the relative humidity of the air is appreciably decreased, and a sensation of dryness is produced, due to the more rapid evaporation of moisture from

the skin and respiratory channels. Attempts are sometimes made to restore the relative humidity by "evaporating" trays, or pots of water, around the radiators and gas fires; but when it is remembered that raising the temperature of air from 40 deg. F. to 60 deg. F. reduces its relative humidity by about 50 per cent. it is obvious that these cannot be adequate. Air at 60 deg. F. (dry bulb) will contain 5.8 grains of moisture per cubic foot when fully saturated; whereas at 30 deg. F., 1.9 grains per cubic foot are sufficient to produce 100 per cent. relative humidity. Air on being heated continues to absorb moisture until it becomes saturated, and unless this moisture is supplied artificially it will be abstracted from the occupants and furniture contained in the room. The absence of air movement is another contributing cause of the feeling of unpleasantness in a badly heated room. Apart from the open fire, which acts as a natural ventilating shaft by means of the chimney (so drawing air into and through the room), nearly all other heating apparatus produces little or no air movement, except the very slowly-moving convection

currents. Air motion is essential to comfort. One's feelings of oppression on a still, muggy, or thundery day are due to the film of moisture arising from the skin emanations not being freely removed from the body. This retards the natural function of the skin and throws more work upon the other excretory organs, with resultant inertia and consequent feelings of fatigue from the lessened cleansing of the blood stream. These physiological considerations have a decided bearing upon the question of heating and ventilation, and when their importance is properly appreciated this commonly used expression will no doubt be changed to that heading the present article.

The main object is to provide for the comfort of the occupants of a building. The first consideration should, accordingly, be to provide a supply of suitably "conditioned" air to each occupant, and the calculations should, therefore, be based upon the number of people likely to occupy any particular room, with allowance for a definite and constant volume of air supply per person. During the periods when the building is unoccupied a system of direct heating

may be employed to keep the building warm and avoid too long in "heating-up." This would be needed in the case of large single-room buildings, like churches and assembly halls. The volume of air per occupant having been determined, the relative humidity and temperature calculations will then follow according to the exposure factors of the particular room.

A properly designed installation of this kind will call for a dual system of distributing ducts, one to convey the heated air and one for the cold humidified air. The hot and cold air distributing ducts would be interconnected at their point of entry to the various rooms, in the form of a mixing chamber with regulating dampers, to admit of the supplies of hot and cold air being regulated at the will of the occupants according to their requirements and the outside atmospheric conditions. The usual extract air duct should be led back to the main chamber to enable the exhaust air to be purified and re-heated. The main chamber would contain the air-washers and humidifiers, heater batteries, fans and boilers, and these should be fitted with a system of automatic temperature and humidity control.

HOUSE HEATING

Under this title* Miss Fishenden has produced a book which is an extremely valuable contribution to the question of fuels. A very large amount of the information has been collected and annotated for the first time, and appears in a readily understandable form, and contains many facts which, while being of the highest importance, are not by any means universally known. Comparisons are made between the use of wood, peat, coal, anthracite, coke, gas, and other materials as means of obtaining heat.

In connection with the manufacture of gas it will come as a surprise to many to find that the efficiency of the present systems of manufacture is far less than might have been expected. Quotations are given, showing that 18 per cent. of the original heat units is sold in the form of coke, 11.4 per cent. is absorbed in the coke for producing gas, 21.3 per cent. is the proportion of gas, 6.1 per cent. of tar, and the remaining 13.4 per cent. liquor, sulphur and loss. Even in the most efficient of modern gas plants the number of heat units gas is not greater than 25 per cent. to 35 per cent. of the total heat units in the original coal. Another authority states that of 100 heat units in the original coal, 50 are returned in the solid fuel market as coke, 5 are recovered as tar, 22.5 are lost in manufacture

and distribution, and 22.5 reach the consumer as gas. These figures are sufficient to explain to the architect the reason for the high cost of gas heating, which he finds to be typical of all cases in which he is able to compare gas with coke or coal heating apparatus.

Following these figures, Miss Fishenden devotes a number of pages to the discussion of revised or improved processes for increasing the yield of gas or increasing its efficiency when used in gas-heating apparatus. The author points out that the use of low-grade gas has become possible by recent improvements in gas burners. As a result of this development, the decision to charge for gas by the therm arose, which decision Miss Fishenden defends in a very logical manner. The use of low temperature carbonisation of coal yielding a certain amount of gas and leaving a brighter burning material than coke seems to possess possibilities which have not yet been completely investigated.

Proceeding further to examine the generation of electricity, it is found that an even higher proportion of heat units is lost, and it is stated that the average thermal efficiency of the generation of electricity is only 12 per cent. of the value of the original number of British thermal units in the coal used. For the best station in the country, the efficiency is only 18 per cent. The contention of some electrical enthusiasts that huge power stations

at a few points would involve an enormous increase in the efficiency of the current produced is not, apparently, borne out by existing figures. Recent improvements in the efficiency of generating stations have, however, resulted in a very large total saving of fuel.

The second section of the book is devoted to a study of the development of the modern grate and of the application of coal to the heating of rooms. Some interesting information is given in connection with Teale's rules for fire-grate construction, most, if not all, of which have passed into general practice in the construction of modern fire-grates. Harcourt's rules do not entirely agree with those of Teale, but are sufficiently consistent and logical to make their differences easily reconcilable.

There is some interesting information upon the quantity of air which passes through a normal room heated by an open fire, and also upon the effect of radiation upon the human body. The cooling effects of draughts are insisted upon, as is also the incomplete combustion which takes place in coal burning in an ordinary grate.

The effects of patent preparations on the efficiency of coal fires is shown to be negligible, and chemical analyses of two patent preparations are given showing that they consist almost entirely of common salt. The exhaustive way in which various aspects of the coal fire are treated, and the very concise statements that

* "House Heating," by Margaret Fishenden, D.Sc., Inst. P. Witherby, 25/- net.

are made, provide most valuable data for the architect, as well as a basis for further investigation, the importance of which it is impossible to exaggerate.

Chapter III is devoted to the history, design and present uses of kitchen ranges. The result of heating in ordinary brick-set kitchen ranges, quoted from Barker's "Tests on Ranges and Cooking Appliances," is very illuminating. According to this statement 3 per cent. of the heat is communicated to food, 7 per cent. to the hot-water supply, and the remainder is lost in the air of the kitchen, absorbed in the brickwork, or disappears up the flue. Miss Fishenden points out, however, that the kitchener is asked to perform several diverse operations, and cannot be expected to show a high efficiency in each. Its "general utility" accounts for its continued popularity.

The book contains excellent statements upon the comparative merits and uses of the average kitchener, either "portable" or otherwise, and various types of combined sitting-room fires and ovens, and the use of independent boilers, with or without the addition of cooking ovens. Miss Fishenden's comments in these matters are extremely sound.

Chapter IV deals with gas for heating purposes, and points out the immense impetus which was given to the use of gas fires by the invention of Bunsen burners. It explodes many of the objections to gas fires based upon their presumed lack of ventilation, the supposed emission of unpleasant smells, &c. It shows that many of these criticisms are due to

prejudice surviving from the early days of the gas-fire, when such defects existed to a serious degree. Sections of this chapter which are very interesting refer to the effect of carbon dioxide and carbon monoxide, and the effects of oxides of nitrogen upon health. At the end of the chapter extracts are given from reports upon the death-rate due to accidental deaths from gas-poisoning, which prove that it is almost negligible.

The use of gas for cooking is discussed at considerable length, and it is shown that whilst the production of gas has a relatively low efficiency, gas apparatus has a very high efficiency, and to a large extent balances the cost of the production. If it were possible substantially to improve the efficiency of production and only slightly improve the efficiency of gas apparatus, the use of gas for all heating purposes would be advanced tremendously. One of the most valuable contributions of this portion of the subject is found in the form of a definite comparison between the cost of cooking by gas and by coal, and a further comparison of the cost of gas used for heating water. The total quantity of gas sold by authorised undertakings was 74,000,000,000 cubic feet in 1884 and 241,000,000,000 cubic feet in 1920, an increase of rather more than three times.

Short as has been the history of electricity for heating, modern electrical heaters give an efficiency of 100 per cent. As has been before stated, the production of electricity shows an efficiency of 12 per cent. to 18 per cent., and

it follows that electric heat is from six to ten times dearer than heating by coal. Coal-heating apparatus, however, has an efficiency approximately 50 per cent., and this difference, therefore, is reduced to 3 to 5½ times.

Miss Fishenden's work will undoubtedly come to be regarded as a standard volume. It covers a wide ground, but is perhaps unfairly restricted so far as its title is concerned. Much of the information is applicable to all schemes of all descriptions, and much of the experimental work which has necessarily preceded its production appears to have almost a world-wide importance.

† Mr. Edwin Gunn's book in the *Coun-try Life* series, "How to Heat Your House," suffers somewhat by comparison with a comprehensive work like that of Miss Fishenden. Nevertheless, it contains in a concise manner a great deal of very valuable information upon various kinds of fuel and the methods by which they can be applied to modern house heating. Illustrations of various types of heaters convey an idea of their use and value very rapidly, and altogether this is an admirable little book for those who require a short survey of the subject. It is a defect in a book of this character that advertisements are added of individual examples of the types of apparatus referred to.

† "How to Heat your House," by Edwin Gunn. *Coun-try Life*, 2/6.

THE PROGRESS OF GAS HEATING

As year succeeds year, it might be thought that the speed of the increase in the use of gas for heating in its various forms would slow up, but this, at present, is far from being the case. On the contrary, its progress continues unchecked; indeed, it is constantly gaining impetus. As some proof of this may be quoted the fact that one large gas undertaking alone had an increased output of nearly 30,000 gas fires in the year 1923 and nearly 40,000 in 1924.

The causes of this increase are many, but the most outstanding are the ever-present servant problem, which remains—and, apparently, will always remain—insoluble; and the fact that the present generation have really begun thoroughly to appreciate the value of having heat in any room instantly and economically available and controllable on tap. Whether domestics who would be willing to light and clean up after solid fuel fires are—or become—available or not, this latter aspect of the case will always remain unaltered, and will, indeed, become an increasingly potent factor.

It would appear that the application of gas for firing steam and hot water boilers for the provision of heat to batteries of radiators used in conjunction with ventilating systems is beginning to increase, the likelihood of which has been indicated in *The Builder* from time to time. In spite of the increased fuel cost, arising out of the use of gas instead of coke, its convenience and complete and automatic adaptability and the saving of space and other advantages accompanying its use are causing it to be adopted for a number of installations, some of which are of a magnitude which would have been undreamed of a few years ago with gas as the heating agent.

As some confirmation of this, it need only be mentioned that we hear of one such contemplated installation for which gas has been chosen, where no less than six million B.Th.U's. per hour will be needed to warm the air for the ventilation of the premises. For this purpose, gas boilers with a total maximum consumption of 15,000 cubic feet (75 therms) per hour are to be fixed on the roof of a large building. Architects will readily realise the potentialities

attached to such an installation when the value of space in the basements of modern offices, shops, or stores buildings, is considered. There are, of course, numerous cases where coke as the heating agent for central heating systems is supreme—for instance, when low fuel cost is the prime factor to be considered and/or where labour and space are readily available.

A further modern feature is a combined coke and gas-fired system, in which gas is used for domestic hot water for sinks, baths and so on during the summer; and in the winter, coke is used for all these, and, in addition, one or more radiators. Another system more frequently met with involves the use of a coke boiler for central heating purposes, while gas fires are also installed as auxiliaries in each room. The latter are appreciated for their cheery effect, and they are available for use between seasons when the coke boiler is not in operation.

The fitting of gas fires against existing coal grates and to specially prepared economy flues, however, still accounts for by far the greater proportion of the growth of gas heating. Details of several installations, combining both utility and beauty of appearance, and which are likely to be of special interest to architects and builders, follow. Reference is also made to an instance of the use of gas as the sole heating agent for a small central heating installation.

The Overseas League.

Some very interesting gas installations have recently been put into the several buildings now occupied by the Overseas League. This League has become increasingly important since it was founded by Mr. John Evelyn Wrench in 1910. Owing to his untiring efforts this non-party, non-sectarian society of men and women, (British citizens) in and from all parts of the British Commonwealth of Nations, has progressed from the occupation of one small room to the possession and occupation of several large modern buildings in the heart of London's Clubland. Its headquarters are at, Vernon House, Park-place, St. James's-street, where a system of central heating by hot water radiators

heated from a coke-fired boiler was installed as the main source of heat.

The radiators, where they are fitted in the beautiful rooms contained in this fine old house which was originally owned by Lord Hillingdon are masked or hidden behind ornamental gratings, suitably constructed to tone with the decorations of the rooms in which they are fitted. In addition to the central heating system, however, gas fires have been fitted all the fireplaces ready for use at a moment's notice as auxiliaries. Besides supplementing the heat from the hot water radiators, gas fires afford a bright and cheery appearance. Their brightness naturally appeals to Englishmen who have spent years away from home and they remind our kinsmen from the dominions of the old open fires of the past. There are twenty-five gas fires all carefully chosen and fitted to conform to the grates and their surroundings. The success which has been achieved in this direction will readily be realised on a glance at the photographs which illustrate several of these fires.

Fig. 1 is a photograph of the "Adam" grate in the Council Chamber and Reception Room where not only is there an "Adam" marble but the grate itself is of steel in "Adam" design. It will be seen that the gas fire is of "Adam" design. In order that nothing shall clash, it is made in "armour bright" steel, and the small opening, which would have been left above the bars of the coal grate, has been covered in by a steel plate backing, finished to match. The illustration also shows photographs of H.R.H. The Duke of York, President of the League, and the Duchess of York.

Fig. 2 shows the drawing-room fireplace which is of the Georgian period. It was decided in this case to retain the old dog grate, a modern type of gas burner fire was accordingly fixed therein, which, it will be agreed, has detracted from the appearance of the fireplace grate in any way.

Fig. 3 is a photograph of the very beautiful fireplace in the dining-room. This also is of Georgian period, with Ionic columns capitals, and above the grate opening will

Lord Hillington's Coat of Arms. In this case, again, it was considered undesirable to alter the character of the original dog grate, so a gas fire was successfully fitted to its interior. At Vernon House there are also several gas team radiators fixed in those corridors where there are no hot-water radiators, and gas cooking apparatus has been installed to provide meals for no less than 150 persons.

At "Club House," adjoining, there is also a central heating system, supplemented by seven gas fires, and gas cooking apparatus is installed capable of cooking for 80 persons. Overseas House, also adjoining, is chiefly used for sleeping accommodation, and here there is central heating and six gas fires, with gas cooking apparatus for the provision of breakfasts.

The Institute of Hygiene.

If further proof were necessary that gas fires and other gas appliances are perfectly hygienic, it has again been afforded by gas being installed for heating, water heating and cooking at the new premises of the Institute of Hygiene. This institute was founded in 1903, and from that date till recently it has occupied premises at 33 and 34, Devonshire-street in the Harley-street area of London. Some time ago it was decided to transfer the activities of the Institute (which include research work and a permanent exhibit of hygienic products and appliances) to more commodious premises in Portland-place, the formal opening of which was carried out on June 5, 1925, by H.R.H. Princess Mary, Countess of Lascelles. The gas installation includes gas fires (13 in all) in the various rooms, and here again these appliances had to be carefully chosen and fitted to conform to the very fine series of fireplaces which were in existence on the premises.

In addition to the gas fires for the general heating of the building, there is a hot-water and central-heating installation of rather unusual character. A Potterton combined coke and gas boiler is connected to radiators, with a heating surface of 75 square feet, installed in the hall and basement, and the same apparatus also supplies domestic hot water for scullery, cleaning and lavatory purposes.

In the summer when the radiators are not required, the gas boiler is used to furnish the domestic hot water, as a result of which an intermittent demand is economically met, while the kitchen is not unduly heated. During this period the coke boiler is merely used as an incinerator, but in the winter when the supply to the radiators is brought into play by the operation of valves, the coke boiler is used as the heating agent, because it is more economical than gas for the heavier and more constant load.

The domestic hot water supply is installed on the cylinder system, with the storage in the kitchen quite close to the apparatus, and the cylinder is fitted with a Potterton cut-out valve, so that the whole or only a portion of its contents may be heated as desired, thus further economising in the consumption of gas when this is in use during the summer months.

Some interesting work was carried out in connection with the conversion to gas equipment of the fireplace in the toilet section which is situated on the ground floor of the building. The mantelpiece and jambs of this fireplace are of Verde-antique marble, and the hearth and curb of Statuary marble. As the fireplace called for special treatment it was decided to cover the whole of the space between the jambs with a sheet of scagliola marble, which was specially made by Messrs. Bellman, Ivy & Carter, of Marylebone. A suitable opening was left in this sheet through which the flue outlet of the gas fire was carried to convey the products of combustion to the chimney. The marble backing having been made of the correct size, it was carefully fitted into the opening, its surrounding

edges being plastered to ensure a firm setting. The gas fire is a Davis "Louis Seize" pattern, which was chosen to harmonise with the character and decoration of the room, including the ceiling. The fire is finished in electro-silver with gold mountings, and an added artistic touch is given to the whole by the gas fire supply pipe being lacquered steel bronze to tone with the finish of the fire. The flooring of this room is of a patent rubber supplied by Spencer Moulton & Co., Ltd.

Fig. 4 illustrates the Lecture Room on the first floor of the Institute of Hygiene. Here, again, a very fine fireplace had suitably to be treated for the installation of a gas fire in front of the coal grate which had previously been in use. The mantelshef, jambs and hearth are of Statuary marble, as are the statuettes and lamp-holders seen on either side of the fireplace. The gas fire chosen and fitted is a John Wright's "Kenilworth," in electro-silver finish, and again a backing of scagliola marble was fitted and the gas supply pipe was lacquered to tone with the fire. These backings may be obtained in any shade, either in plain, or any pattern of marble, and in any size needed to fit a particular opening.

Other items of gas apparatus play a large part in the equipment of a model kitchen, which is one of the special features of the Institute; and gas cooking stoves are also installed in a demonstration room, in which, from time to time, hygienic and practical cookery is carried out in conjunction with suitable lectures, which are given by skilled operators. Full descriptions of such apparatus, however, are not called for in a number which is specially devoted to the subject of heating and ventilating.

The Reconstructed Westminster Hospital.

Westminster Hospital was recently reconstructed and modernised under the direction of Messrs. Adams & Holden, F.F.R.I.B.A. Among the many improvements was the re-organization of the heating and cooking arrangements. As a result, the whole of the building is warmed by steam-heated radiators [supplemented by gas fires; while gas and steam are

1.—Gas Fire in Council Chamber, Overseas League.

Fig. 2.—Gas Fire in Drawing Room, Overseas League.

used for cooking in the main kitchen. A gas cooking stove is also fitted in each ward kitchen, and gas appliances of various kinds are used for sterilizing and in the laboratories. The heating installation is of the greatest interest at the moment, however, and it is worthy of note that there are no less than 181 gas fires now fitted in the hospital, one or more being installed in every general and private ward in the building.

The steam radiators which are also installed throughout the building are heated from two large coke-fired boilers, but as such heating (by high temperature convection), has a tendency to overheat the air, it was arranged that the radiators should not be large enough to provide sufficient heat satisfactorily to warm the wards and other rooms in which they were to be placed, and it was therefore decided to instal gas fires to supplement their heat to the desired degree. The gas fires also serve another purpose, inasmuch as their cheerful radiance has a beneficial psychological effect on the patients. The rooms of the resident medical staff, the matron's rooms, and every one of the nurses' bedrooms (sixty in number) are equipped with gas fires.

Space will not permit the inclusion in this article of illustrations of the fireplaces and gas fires in the various wards and rooms, but reference may be made to one of the adult wards, where the gas fire is a Davis "Pandora," a design which was chosen on account of its simple though artistic lines. The coal fire opening has been entirely filled in behind the gas fire with a backing of "Astestone," which is screwed (with wood screws) to a framing of wood battens. A suitably

prepared opening is left in the backing through which the flue from the gas fire passes to the chimney.

The description which has been given of the very comprehensive gas installation at the hospital is necessarily lacking in detail but, brief as it is, it will serve to give an insight into the careful attention which is paid by the governing bodies of great hospitals to the

comfort and well-being of their patients and staff.

University College of London, Gower-street.

An interesting installation of the central heating type was recently carried out at the above premises to the instructions of the architect, Mr. F. M. Simpson, F.R.I.B.A. It is a practical illustration of the accuracy of the statement which has from time to time been put forward that, while up to the present it is by no means the usual practice to use gas as the heating agent for central heating installations of magnitude, there are cases of somewhat minor character where a convenient and readily controllable fuel as gas is indicated.

In this case there were nine animal houses (in which such animals as dogs, rats and mice are kept under scientific observation) to be heated to a regular and constant temperature of rather more than 70 deg. F. These requirements were fulfilled in the following manner: Two gas-fired boilers of suitable capacity were installed, and from these were run the hot water supplies to twelve National Radiator Company's "Classic" radiators which were distributed in suitable sizes and capacities in the various houses.

When the boilers are lighted the desired temperature is very quickly reached, and it is maintained steadily and constantly for an indefinite period, the gas supply to the boilers being automatically controlled and the consumption thus kept to the amount necessary to maintain the heat. It is worthy of note that the apparatus needs practically no attention. The regulation is achieved by the action of a Potterton Air Thermostat which has been previously described in *The Builder*. If when the air temperature increases beyond the desired degree, the air thermostat which is fitted on the gas supply pipe passes through the houses on its way to the boiler, once comes into operation, and actuates a valve which temporarily shuts down the gas.

When, owing to this reduction in gas consumption, the temperature begins to fall, a reverse action takes place, and the gas supply is automatically again increased, the balance always being maintained by this simple device which not only keeps the temperature at the desired degree, but at the same time ensures the strictest economy in gas consumption.

The contract for a new church to be erected at the corner of Beswick-avenue and Coleridge-road, Ensby Park, Bournemouth, has been awarded to Messrs. Marshall & Bower. The architect is Messrs. George Baines & Son, F.R.I.B.A.

THE PANEL SYSTEM OF WARMING

A SYSTEM of warming which depends for its efficacy on the complete concealment of the warming agent is known as the Panel system, and although it has been used and developed in important buildings for the past fifteen years, the fact that it has been adopted in four of the largest buildings now being erected in the United Kingdom renders a description of the principle upon which it operates and the method adopted in its installation of special interest at the moment.

With this system the occupants of the building to which it is applied receive the warmth necessary for their comfort directly from the source in the form of radiant heat. Now, in the minds of most people the term "radiant heat" connotes a source of warmth which is luminous, but it is a mistake to suppose that heat can be radiated only at such temperatures as produce visible radiation. Heat is radiated from all bodies whose temperatures are above absolute zero, and of three bodies at different temperatures radiation is absorbed by the body at the middle from the body at the higher temperature and radiated to the body at the lower temperature. Thus a human being standing in a room three of the walls of which are at, say, 55 deg. Fahr., while the fourth is at 90 deg. Fahr., will be conscious of a sensation of warmth from the warm wall even although it is actually at a temperature lower than blood temperature, and this warmth will reach him even though the intervening air be at a still lower temperature of, say, 45 deg. Fahr., because radiant heat, being an etheric phenomenon, passes through air without appreciably warming it. Such an effect is common experience on a sunny day in winter, when, even with an air temperature below freezing point, the warmth of the sun, which is radiant warmth, is plainly felt through the clothes.

In the Panel system of warming, the warmth is distributed by extended surfaces in the form of portions of the ceilings, walls and sometimes of the floors, which are maintained at a suitable temperature, generally about 120 deg. Fahr., by warm water circulating through pipes embedded in the concrete, plaster or similar plastic constituent of the structure or finish.

The warmth is radiated in straight lines in all directions exactly as in the case of luminous radiation, and is reflected or absorbed more or less by the surfaces upon which it impinges. Such of the radiation, therefore, as is not absorbed by the occupants of a panel-warmed room is reflected back and forth by the walls, floor and ceiling and furniture, all of which in due course reach a temperature at which they no longer cause loss of warmth on the part of the occupants, who thus experience a quality and degree of comfort comparable to that provided by mild sunshine.

It is important to observe that this degree of comfort is obtained without appreciably warming the air; there is, therefore, with this system no sensation of stuffiness, dryness of the throat, and lassitude, nor is there the consequent dissemination of dust and deleterious germs. And since there is no stratum of heated air at ceiling level, there is no loss of heat due to the escape of this hot air from windows, doors and other openings, and the avoidance of this loss results, in conjunction with the moderate temperature at which the water is maintained, in a considerable economy in fuel.

As stated above, the panels consist of jointless coils or grids of small bore pipe embedded in the lower surfaces of the ceilings or the inner surfaces of the walls; the warm water is caused to circulate in these coils in exactly the same manner as in an ordinary low-pressure hot-water heating system; accelerating pumps are used when necessary, but gravity circulation is frequently adopted where the lay-out permits.

Where the floors are of concrete, either solid or in one of the many forms involving the use of hollow tiles or beams, the pipes are cast in the concrete, being laid in the shuttering before the concrete is poured; in many cases, it is possible also to embed the mains, risers and circulating branches in the concrete casing of the steel structural members, thus completely concealing the whole of the pipework. This method is being adopted at the two large buildings now in course of construction on the Devonshire House site, at the new Carmelite House, and in the new India building at Liverpool. In such

installations, of course, all joints are welded and the work is subjected to stringent tests before the concrete is cast. Moreover, great care and experience are required to ensure that the arrangement of panel coils and circulating pipe-work is such as will enable the system to vent itself automatically.

When the construction does not permit of casting the pipes in concrete, the panel coils may be applied to the surfaces of the ceilings or walls and encased in the plaster; or, if marble, slate, tiles or similar wall finishes are to be used, the panel coils are rendered with cement, which forms a bed for the surface material.

Panels cast in concrete require no more than the normal thickness of plaster to cover them; but when the pipes are applied to a hollow tile or wood joist ceiling or to brick walls, plaster to a thickness of about 1½ in. is necessary. In both cases, precautions have to be taken by the plasterer in accordance with instructions prepared by the patentees, as a result of their experience, in order to ensure that the plaster shall not crack.

The use of the ceiling as the source of warmth, while it may appear somewhat revolutionary, has been marked by conspicuous success. Not only does it emphasise the similarity between this system of warming and sunshine, but it has several practical advantages. Not the least of these is the fact that it enables maximum use to be made of the walls and floor, a feature of considerable importance in department stores and similar establishments. It renders possible the erection and dismantling of partitions in large apartments without disturbance of the heating system, and without the necessity for rearrangement, which is of great utility in office buildings, workrooms and warehouses.

To hospitals, the system is peculiarly applicable owing to the absence of all exposed pipes, radiators, and similar lodgments for dirt and dust, and to the hygienic value of the quality of warmth which it provides. The new Obstetric Block at University College Hospital, and the extensions of the Bolingbroke Hospital, Wandsworth, are instances of hospitals in which it is being used. The patentees are Messrs. Richard Crittall & Co., Ltd.

OIL FUEL FOR CENTRAL HEATING

Oil fuel is being increasingly used for boiler installations with completely satisfactory results. In North America, the efforts made to evolve an efficient apparatus have met with a large degree of success, and there are now thousands of oil-fired central heating installations in daily operation in Canada and the United States. The technical staff of Messrs. Shell-Mex, Ltd., in co-operation with oil burner manufacturers and heating engineers, and after three years of experiment, have designed a British plant which can be applied to any ordinary central heating boiler and which is sufficiently simple and reliable to be left unattended for long periods without the risk of a breakdown.

The plant, which is automatically controlled, can be used either with the ordinary cast iron section boiler fired with coal or coke or with the new types of central heating boiler, specially designed for oil fuel, which are now produced by the leading heating plant manufacturers.

The accompanying illustration shows a hot water central heating plant installed in the basement of an old house of the Georgian period, now used as the London offices of a life assurance company. The system of working, summarised, is as follows:—

(1) An air blast at low pressure is provided by a small electrically driven fan, the operating cost of which only amounts to a fraction of a penny an hour. This current of air operates a rotary oil atomiser (or Rotamiser) which

Interior of Messrs. Harvey & Nichols' Premises, Knightsbridge, fitted with the Panel System of Warming.

An Oil-Burning Hot-Water Central Heating Plant.

converts the liquid fuel into an oil mist. The oil mist is intermingled with the correct proportion of air and passes forward into the furnace of the boiler. Perfectly smokeless combustion is obtained although the consumption of oil may be varied from a quarter of a gallon to four gallons an hour. Thus the system admits of extreme flexibility and is capable of dealing with any fluctuations in demand likely to be experienced in this country.

(2) An automatic valve, by means of which the oil feed is regulated according to the temperature of the outgoing water, is fitted to the oil supply pipes.

(3) If the electricity or the air supply should fail, a simple automatic device immediately cuts off the oil supply to the furnace and it is not renewed until the fault has been remedied. This eliminates all danger of oil running into a furnace in which the flame has been extinguished.

(4) After the burner is lit in the morning the temperature of the water rapidly rises until a pre-determined point is reached, say 180 deg. F. This figure can be varied by setting a pointer against the desired temperature as indicated on a graduated scale. On reaching the set temperature, the automatic valve comes into operation and the oil supply is cut down until the burner is passing just sufficient oil to maintain the water temperature at the determined degree. Should the temperature of the water rise owing to radiators being shut off or changes in atmospheric conditions, the valve automatically reduces the oil supply and, conversely, should the temperature of the water fall below the critical point, the valve immediately increases the oil supply until the point of balance is again reached. It is thus possible to meet the widest variations in the demands on the plant without the necessity for an attendant.

In the installation illustrated the boiler is heating water for 56 radiators, the pre-determined temperature being usually 180 deg. F. To maintain this temperature the burner consumes an average of two gallons of Mex fuel oil an hour. Deliveries of oil are made by connecting a hose pipe from the tank wagon to a pipe connection in a manhole in the pavement.

Messrs. Shell-Mex, Ltd., do not manufacture oil burning plant, but maintain a special department for the purpose of advising on the selection of the most suitable oil burning apparatus for each individual requirement.

SOME NOTES ON HEATING EQUIPMENT

The "Ideal" School Radiator.

The National Radiator Co., Ltd., have issued a leaflet dealing with a radiator which has been specially designed to meet the requirements of schools and other public buildings where efficiency and cleanliness are of first importance. The smooth surfaces of their "Ideal" school radiator and the wide space (1½ in.) between the sections, as well as that below the bottom hub, enable all parts, including the floor beneath, to be easily cleaned. (If desired, the radiators can be supplied without feet, for fixing on brackets to the wall, leaving the floor entirely clear.) The "Ideal" concealed valve gives the advantage of a top feed to radiators having supply and return connections at bottom, this being secured by assembling the first and second sections at bottom with a solid malleable iron nipple, so that the water upon entering rises up the first section before passing through the radiator under control of the valve. The top radiator nipple is faced and forms a seating for the valve, which is fitted in the top radiator hub, and projects only a short distance: the body thus being concealed, a neat appearance is obtained.

Rustless Firegrates.

The average Englishman does not always pay sufficient attention to his firegrate which, after all, is or should be the most arresting feature and, therefore, the centre of interest of his room. The Carron Co. has "brightened things up" (if the term may be allowed) by the introduction of the rustless steel firegrate, which, on account of its metallic lustre, invests the fireplace with a new charm and brightness. It imparts a distinctiveness to the room, and is specially in sympathy with period decoration. The housewife too, will, welcome its adoption as it minimises labour involved in cleaning, for instead of the troublesome and dirty blackleading imperative to the cleanliness of the old-fashioned grate a cursory dusting will restore it to its original brightness—brightness moreover which it will never lose owing to the rustless steel being solid. The booklet illustrates a score of these handsome fireplaces, one of which we reproduce, which can be supplied to specification, but the Com-

pany are in a position to submit many other designs in this new material, to harmonise with any style of furnishing. Those interested in the new development of firegrate should call at the showrooms at 50, Berners-street, London, W.

Thermostoves.

We have received a booklet from Messrs. Hartley & Sugden, Ltd., dealing with their patent Thermostoves, of which they have produced a "Cottage" model. Statistics prepared prove that only 15 per cent. of the heat engendered by a kitchen range is used, i.e., that it has an efficiency of 15 per cent. The Thermostove, it is claimed, has an efficiency of nearly 75 per cent., a big increase on the old method of heating. This means, therefore, a 10 per cent. decrease in the amount of fuel required; and it is claimed that the initial outlay is so regained by the cut in running expenses. Besides the question of expense, the advantages this stove possesses should be taken into consideration. It ensures a continuous and abundant supply of hot water day and night; cooks, bakes or roasts any food and boils pans, all from one fire which burns coke, anthracite or any solid fuel, while Models 1, 2 and 5 will, in addition, heat three small radiators and a towel rail. Nos. 5 and 6 have patent sliding oven doors fitted with no heating handles, and a patent lifting firegrate which enables the whole fire to be lifted near the oven and hot plates if desired. The new "Cottage" model is smaller and more compact and claimed to solve the problem of economy in space, fuel and labour in the small house. Those interested should call at the company's showrooms at 215, Tottenham Court-road, W.

Domestic Hot-Water Supply.

The illustration on page 467 shows the hot water supply for a house at Cholesbury, Bucks, designed by Messrs. T. P. Bennett & Son, architects. The scheme included the installation of a boiler to supply heating to the whole of the house by means of radiators, raising the temperature of the rooms on the ground floor to 60 deg. F., and on the first floor to 55 deg. F., when the outside temperature is 32 deg. F. The radiators are heated on a low-pressure hot-water circulation and are each provided with two nickel-plated gun-metal shut-off valves, so that each radiator can be completely disconnected from the

A Carron Fireplace Suite.

ulator without destroying the heat to the
er units. The hot-water supply is obtained
n a "Duplus" copper calorifier filled with
copper coil. There are eight radiators in
completed installation of "Classic" design,
le hot-water is supplied in seven points in
ious parts of the house. The cost of the
tem was £125. A water supply was unobtain-
e on this site, and rainwater storage tanks
e laid down, water being pumped into a
ter storage tank above the linen cupboard
supply the heating system.

Well Fires.

We have received two very artistic brochures
on the Well Fire and Foundry Co., Ltd.,
5, Berners-street, W.1, illustrating the
tent fireplaces which they are now pro-
cing in a glazed ceramic material and
wide range of delightful colourings.
e Well Fire is composed of a well and back
ck, both made of the finest selected Stour-
age freclay, which possesses a high radiating
ciency. The "Well" bottombrick is con-
ected with ventilating air-channels con-
lled by means of ventilators. Air is
ducted through these channels, which,
ng immediately beneath the fire, are usually
the same temperature as the fire; conse-
ntly the air, in its passage through these
nnels, is raised to that of the fire itself;
result is that the superheated air, uniting
h the smoke, causes it to burst into flame,
s consuming smoke which would otherwise
lost in the chimney. (This explains why
Fire has cured a large number of smoky
nneys.) The accompanying illustration
s one of the firm's latest designs.
proof of the thoroughness of the fire's
umption lies in the fact that only a hand-
of fine ashes is left after a day's burning
r need the fire be attended to after it
t.

ARCHITECTS' & BUILDERS' INQUIRY BUREAU

We are glad to give questions and answers, but cannot accept responsibility for contributed replies, especially on legal matters.

May we appeal to our correspondents to submit their queries on paper of a size easily filed, and written as legibly as possible, or, better still, in typewriting?—Ed.

Penalty Clause in Contract.

[REPLY TO W. L. CARTER, SEPTEMBER 18.]

SIR,—It should always be borne in mind that the sum appearing in the clause stated is not by way of being a penalty, but the agreed and ascertained amount of damages which the employer shall be held to suffer by the delay in completing the work, and as such must be commensurable with the probable or actual loss; the operation does not depend upon the granting of a bonus for early completion. On the other hand, I am of the personal opinion that a properly drawn clause securing a bonus to the builder in the circumstances named should be more efficacious, provided the employer is covered against the inducement which this naturally gives to the builder to rush the work. I know of no case where the legality of the clause in question has been successfully challenged.

S. R. M.

SIR,—A contract is an agreement enforceable at law between two definite parties directly creating an obligation. If the contract provides for bonuses to be paid to the contractor for earlier or punctual completion, coupled with the penalties or liquidated damages for delay, the contractor, in order to claim such bonuses, must complete at the time they became due under the contract, or he must show hindrance on the part of the employer or the architect. In *Leslie & Co. v. Metropolitan Asylums Board* (1901), 68 J.P. 86, it was held where sub-contractors had contracted direct with the employers and

had caused delay to the general contractors for the whole work, that the latter were nevertheless entitled to the bonus for punctual completion.

The fact that no provision has been made for a bonus should the contractor finish before the time agreed upon, does not affect his liability for delay in completion, provided the essential elements of a contract are present in the agreement. In this case, the R.I.B.A. form of contract was used, and Clause 24 (which is, of course, subject to other clauses of the contract), is clearly enforceable if there has been nothing on the employer's part to cause the contractor delay.

In general, it may be taken that any party who undertakes expressly or impliedly to do something for a consideration, and does not do it, is liable for any damages which may accrue to the other party to the contract by reason of his neglect or dilatoriness; and this, even if performance of his contract is rendered impracticable by unforeseen circumstances, against which he might have protected himself, by additional terms or conditions in his contract. Nevertheless, since our Courts are now Courts of Equity, relief against legal consequences, in spite of delay, is given on equitable terms. Therefore, to succeed against a contractor where time is not of the essence of the contract, the employer must be prepared to prove lack of skill and dilatoriness on the part of the contractor in completing the contract. For cases bearing on these points, see chapter VI, "Creswell on Building Contracts." "LEGAL."

Obstruction of Light to a Window.

[REPLY TO "MONTAGUE," SEPTEMBER 11.]

SIR,—I should advise "A" to approach "B" with an offer to enter into an agreement under which, in return for a nominal yearly payment, his window may remain unobstructed until the agreement be terminated at will by either party. "A" is then protected, even after removal of the hoarding; and "B's" window cannot become an ancient light while its light is so "rented." The two are neighbours, and a little neighbourly accommodation, under full protection, is all that is needed.

"LIVE AND LET LIVE."

Partnership.

[REPLY TO "ZENITH," SEPTEMBER 11.]

SIR,—For a stable practice, offer one year's income based on the proportion to come to the intending purchaser from the average of the last three years' income of the practice. For instance, if the last three years' incomes of the practice have, say, been £1,200, £1,700 and £1,500 respectively, average £1,500, and if it is proposed to purchase a third share, a fair offer would be £500. In the case of a rising practice it might be worth offering anything up to two years' income according to the prospects. The great thing in these cases is to make thorough investigation as to whether the practice may be considered stable, rising or waning, and the certificate book is not always a good barometer.

"BITTEN."

Porcelain-enamelled Taps.

SIR,—A client has asked me to specify porcelain-enamelled taps to bath and scullery sinks and though I have been told frequently that they are very liable to be damaged by chipping I have never been able to meet anyone who has direct first-hand information upon the subject. I should be obliged if any of your readers would favour me with their experiences.

"CAUTION."

Preservation of Bath Stone.

[REPLY TO "VOX," SEPTEMBER 18.]

SIR,—Apply two coats of a colourless petrifying liquid. Allow a few days to pass between each application. This will preserve the appearance and durability of the stone.

JOHN M. FIFE.

The "Well" Fire.

THE BUILDING TRADE.

SETTING OUT A STAIRCASE.—IV.

(Concluded from page 430, September 13.)

A *Ramp* is the name given to the concave curve in a handrail necessary to raise its height more rapidly than would be achieved by following its general line of rise, as when it comes against and forms part of a newel cap on a staircase landing in which situation a

RAMP.

handrail is run at a higher level than on a stair. For ornamental purposes handrails are sometimes ramped so as to enter the newel post at a level equal to that of the handrail across a level landing. They are likewise ramped at the bottom of the length to enter the bottom newel on the level.

A *Knee* is the reverse of a ramp, being a convex curve in a handrail.

When a knee follows upon a ramp the resultant curve is termed a *Swan's neck*.

A *Scroll Wreath* is the term given to a termination of a handrail in a spiral supported by one or by several clustered balusters. It is struck from a variety of centres, and is frequently found over the curtail step of a geometrical stair. A vertical scroll at the end of a handrail is known as a *Monkey-Tail*.

Square Cut is the term used in description of the modern method of forming a handrail wreath as in distinction from the older method known as the *Bevel Cut System*. In the first, the wreath is cut square from the surface, whilst in the *bevel cut system* the edges of the wreath are cut to a bevel.

The *Tangent System* is a geometrical method of obtaining the true section of a cylinder or other symmetrical solid when cut by an inclined plane, as in a handrail wreath, by enclosing the solid with tangent planes, upon the surfaces of which the inclination of the plane is drawn.

The *springing* is the term applied to that portion of a handrail where a curve commences, and the term is also applied to a similar portion of a string.

A *Core* is the name given to a thin bar sunk and screwed into the underside of a slender handrail to stiffen it.

Balusters, the intermediate supports to a handrail between the newels, are tenoned into the capping of the outer string at their lower end, and housed into a groove in the underside of the handrail at their tops.

The *Pitch of a stairs* is the term signifying the angle with the horizontal of the line drawn tangentially to the nosings of the treads.

Timbering is the name given to the underframing of rough supports of a stair.

A *Pitching Piece* is the name given to a piece of quartering fixed between the wall and newel on the underside of winders, and into which the carriages are framed.

A *Trimmer* is the joint carrying intermediate joists, forming a landing or carrying the ends of the joists cut to form the staircase well.

A *Fascia* is the vertical wrought board affixed to a trimmer round a staircase well.

How to Lay Out Easements.

Where, owing to there being landings and newels on stairs, the line of the handrail, if continued, would cut the newel at different levels, curves, known as goose-necks, and easements are introduced to effect the entrance of the handrail to the newel at the same horizontal height.

The diagram below shows how to lay these out. The line of the handrail of the top flight would, if continued, strike the newel at *a*, and the rail of the handrail of the lower flight at *b*.

To describe the curve of the upper section, take a point *x* at any distance desired above the intersection of the handrail line and the newel and draw a horizontal line *xy*, calling the point where it cuts the lower line of the handrail *y*. From *y* as centre with radius *yx* describe an arc, calling the point at which it cuts the upper line of the handrail *z*. Next produce the line of the face of the newel, cut by the handrail line, and from *z* draw a line at right angles to the line of the handrail until it cuts the vertical line of the newel produced, calling the point of intersection *o*. Then from *o* as centre, and *oz* as radius, describe an arc, which gives the top of the handrail as desired. A parallel curve of the same width will give the bottom line of the curved handrail.

Next from a point horizontal to the points at which the new curve strikes the newel, draw horizontal lines the top one of which has a length

of from 5 in. to 6 in., according to the depth of the handrail, so as to leave a clearance between the underside of the handrail and the newel post. This forms the portion known as the knee. From the ends of these, drop vertical lines to cut the line of the handrail at *c* and *b*. With centre *c* and radius of any convenient length, calling the point *n*, describe an arc *cnm*, calling the point where it cuts the line of the handrail *m*. From *m* draw a horizontal line, and from *m* draw a line at right angles to the line of the handrail, calling the point where these two intersect *M*. Then with centre *O* and radius *on*, describe the arc joining *nm*. This will give the line of the curve of the upper side of the handrail. Extend the radius to the depth of the handrail to obtain the line of the curve of the underside of the handrail.

The newel post may be finished with the detail which has been decided upon at a height suitable to give satisfactory proportions.

Together with this form of handrail usually goes a curved outer string as follows. The bottoms of the two strings, if produced, would cut the newel at different heights, which would look unsightly; consequently, an easement is effected as follows. With centre *O* be the point at which the line of the upper string would cut the newel if produced and radius describe an arc, calling the point at which it cuts the newel *2*. Divide these two distances *O1* and *O2* into equal divisions. Interconnect from one to the other and their points of intersection will give the curve of the easement.

Handrailing.

Handrails are of various types and designs in section, from mop-stick to heavily moulded composite members.

They may be bracketed out on w.i. brackets 3 ft. apart, with fanged ends built into the wall as in an enclosed staircase, or supported by balusters rising from the outer string, or at landings, from a capping mould run along the floor boards.

The handrail should be fixed vertically to the nosing of the tread at a height convenient for grasping with the hand. The height of the upper surface of the handrail from the tread should be from 2 ft. 7½ in. to 2 ft. 8 in., and this there should be added at the landings a height of half a riser; the theory being that in ascending a person is in a less erect attitude than when walking along the level. However, in actual practice, a height of 2 ft. 6 in. for the nosing and of from 3 ft. to 3 ft. 3 in. for the handrail will give greater satisfaction.

The handrail may be fixed to the wall by means of w.i. brackets screwed on, or by a continuous wrought-iron bar, ½ in. thick and as wide as the top of the balusters, the bar being screwed to both handrail and balusters.

The more customary method is that shown below, where it is grooved on its underside to receive the balusters which rise from the

string into which they are housed or mortised and tenoned. The groove on the underside of the handrail is continuous, in order the balusters may be slid into position, where the handrail is fixed, and the groove may be filled in between the balusters if desired where the balusters are in position.

Handrails should, if possible, be run in continuous lengths where straight, but where jointed may either be butted and fastened together with a w.i. plate screwed on under or dowelled and splay-cut.

Balusters are of varying designs, but the principles are the same in that there should be no space greater than 4 in. between them, and also that the face of a riser should line the lower edge of a baluster, the intermediate span being filled with one or more balusters according to design. Where balusters rise from a cut-and-mitred string, the ends of the balusters are mitred against the vertical string bracket, if a bracket is fixed, and the balusters morticed to receive their feet. The top of the nosing is also mitred to receive a baluster planted on over the feet of the balusters and cut bracket.

The method of fixing the handrail to the newel consists of a shoulder cut in the handrail, pinned through the newel with oak pins.

TOWN PLANNING INSTITUTE

The seventh annual Country Meeting of the Town Planning Institute will be held at Canterbury, and by invitation of the Mayor and Corporation and of the Dean, meetings will be at the Guildhall and the Chapter House. The programme is as follows:—

FRIDAY, OCTOBER 2.

10 a.m.—Meeting at Guildhall. Welcome by His Worship the Mayor, Alderman George P. Crombie, M.A. Mr. P. H. Warwick, M.A. and (Y.E. (A.M.)), City Engineer, will read an address entitled "Canterbury—Some Planning Problems."

5 p.m.—Meeting at the Chapter House. Regional Planning in East Kent." Professor Abercrombie, M.A., President. There will be a small exhibition at the Chapter House, of the East Kent Region, arranged by Mr. Archibald (A.M.) and Mr. P. H. Warwick (A.M.).

8 p.m.—Public meeting at the Chapter House. Progressive Programme for Towns and Country," by Mr. G. L. Pepler, F.S.I., Past-President.

SATURDAY, OCTOBER 3.

10 a.m.—The Dean has kindly consented to receive delegates round the Cathedral.

11 a.m.—Tour of the East Kent Region, starting from Palace-street, near the Mint Yard, by School, in single-deck omnibus. Cost, 1s. per head. Visits will be made to some proposed sites for new towns, to the Bettess Farm, Pit, to Richborough, Sandwich, &c., and at Masonic Hall, Deal (3s. 9d.). At 1 p.m., Colonel F. G. Hayward has arranged for the Harbour Board for delegates to be taken to the harbour. There will be an interval for lunch. Return to Canterbury about 6 p.m. 7 p.m.—Dinner at the County Hotel (evening dress).

SUNDAY, OCTOBER 4.

In the morning Mr. P. H. Warwick will take delegates to view one or two of the famous old churches of the city.

11 a.m.—Special Service at the Cathedral, by the Dean.

Arrangements have now been made to take delegates to the County Hotel for the week-end. Bed and breakfast, 9s. 6d. each. It will be convenient for those who have not already done so, to write to the Secretary, Mr. A. R. Potter, 11, Fleet-street, Strand, London, W.C.2, at once, for application forms for hotel accommodation.

Works of Works and Building Foremen's Association Visit.

Over 120 members of the Birmingham and London Branches of the Clerks of Works and Building Foremen's Association were recently guests of the Leckhampton Quarries Co., Leckhampton, Glos. The visitors were accompanied by Mr. C. H. Trevelyan (President of the National Federation), Mr. F. J. Knight (Secretary), Mr. E. T. Howell (President of the Leckhampton Association), and Mr. W. H. Bond (President of the Bristol Association). The party first visited the lime kilns, which are of considerable interest, the plant being a new one with an output of 1,000 tons per week. The quarries, which are remarkable for the size and depth of faces, were next inspected, and on this visit was paid to the yard of the quarry, where a hydrating plant is in course of erection, together with a large masonry building. The visitors were struck by the unusual quality of the polished stone. After a meal was taken, Mr. T. F. Coke (general manager of the quarry company) welcomed the two branches of the Association, mentioning especially the fact that they had the honour of having with them the National President as well as the two Presidents.

CONTRACTS, COMPETITIONS, &c.

For some contracts still open, but not included in this List, see previous issues. Those with an asterisk are advertised in this number. Certain conditions beyond those given in the following information are imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in; the name and address at the end is the person from whom or place where quantities, forms of tender, &c., may be obtained.

BUILDING, PAINTING, ELECTRIC LIGHTING, HEATING, &c.

SEPTEMBER 28.—**Carlisle**.—BUILDING.—Screening and pumping chambers at the new electricity power station, Willow Holme, for the T.C. Henry C. Marks, City Engineer and Surveyor. Deposit 10s.

SEPTEMBER 28.—**Durham**.—ADDITIONS, &c.—To Haverton Hill Council school, for the Durham C.C. Mr. F. Willey, F.R.I.B.A., architect, 34, Old Elvet, Durham.

SEPTEMBER 28.—**East Molesey**.—HOUSES.—Erection of 25 houses at Beauchamp-road, for the East and West Molesey U.D.C. Mr. Gordon Condell, Clerk, Council Offices, St. Mary's-road, East Molesey. Deposit £1 1s.

SEPTEMBER 28.—**Huddersfield**.—HOMES.—Four detached children's homes, at the Leas Scholes, for the B.G. J. Berry & Sons, architects and surveyors, 3, Market-place.

SEPTEMBER 28.—**Hull**.—ALTERATIONS.—Alterations and additions to the car shed, Holderness-road, for the T.C. City Architect. Deposit £2 2s.

SEPTEMBER 28.—**London, N.W.**.—Development of new housing estate at Hendon, for the L.C.C. Administrator of Housing Development Schemes, Old County Hall, Spring-gardens, S.W.1. Deposit £10.

SEPTEMBER 28.—**London, W.4**.—SCHOOL.—Erection of a new brick and brick block Central School, to accommodate 640 scholars, at Staveley-road, Burlington-lane, Chiswick, for the U.D.C. Edward Willis, F.S.I., Inst.C.E., Town Hall, Chiswick. Deposit £3 3s.

SEPTEMBER 28.—**Rathdown**.—WALL.—Retaining wall at the North Beach-road, Greystones, for the Wicklow County Board of Health. R. M. Butler, F.R.I.B.A., 23, Kildare-street, Dublin.

SOUTHEAST-ON-SEA.—The M.H. has sanctioned the loan of £1,693 for the erection of public conveniences in Chalkwell Park for the C.B.

SOUTHSEA.—The Council has passed plans for 114 new houses. The Corporation is considering the question of the development of a new building area at Stanshaw, and it is proposed to erect about 70 working-class dwellings there.

STANLEY.—The U.D.C. has received sanctions from the M.H. for the borrowing of £56,150, £5,250, and £1,250, for the erection of a further 120 houses, with necessary street works and sewers.

SUTTON COLDFIELD.—A proposal is on foot for the erection of a new church near Sutton Coldfield.

TENDRING.—The R.D.C. are to erect 12 houses, 6 at Beaumont, and 6 at Little Holland.

TIVERTON.—The M.H. has approved the R.D.C.'s scheme of 104 houses.

THORNE.—The R.D.C. propose spending £2,000 upon the purchase of Thorne Hall, and its conversion into offices, for which the M.H. have held an inquiry into an application to borrow the money.

WARMLEY.—The Plans and Building Committee recommended the erection of 20 Council houses as follows: Siston and Hanham Abbot's, four each; Oldland and Bitton, six each.

WEALDSTONE.—Plans approved by the U.D.C. included the development of the Bonnersfield estate on extensive lines. No fewer than 214 houses were approved for erection by Mr. J. F. Langer.

WESTCLIFFE.—A proposal for the construction of a pier on Chalkwell-esplanade, has been submitted to the Southend Corporation. The plans provide for a palm court, refreshment room, ball room, pavilion and concert hall, band pavilion, and Badminton courts, together with a floating landing-stage for the use of yachtsmen and bathers. The concert hall and band pavilion will each provide accommodation for 1,500 people.

WESTHAMPTON.—The R.D.C. has approved the erection of 24 more houses on sites at Yarbrook and East Lavant.

WEST HYDE.—The Watford R.D.C. are to build 16 houses near Maple Cross.

WIGAN.—The Council are negotiating for a site for a school at Pemberton.—The Mining and Technical College are proposing extensions to their premises. No architect has yet been appointed to prepare the necessary plans.—The parishioners of St. Andrews are proposing the erection of a Sunday school and mission church on a site in Netherby-road.

WILLESDEN.—A new ward is to be built at the General Hospital, Harlesden-road.

WOLVERHAMPTON.—The Staffordshire Local E.C. intends to provide a new public elementary school for about 900 children on the new Low Hill housing estate.—Bushbury-lane Council School is to be enlarged to provide accommodation for 300 children.

WREXHAM.—The R.D.C. are to apply to the M.H. for sanction to the borrowing of £87,306 for various schemes of road widening, drainage, and the erection of six houses.

YORK.—The Housing Committee propose to invite tenders for the erection of a further 300 houses of the steel frame type.—The Committee are investigating the possibility of converting Nunthorpe Hall and other houses for letting as flats.—A scheme has been prepared for culverting a portion of Tang Hall Beck at a cost of £5,100.—The Estates Committee are to convert premises in Parliament-street lately occupied by the Post Office as a telephone exchange, into offices, at a cost of £1,080.—The Estates Committee are considering a suggestion from the British Music Society as to the necessity for the provision of a concert hall.—The City Council has decided to apply to the M.H. for approval for tenders for the erection of upwards of 300 houses of the steel frame type. The Housing Committee has also decided to build four "all electric" houses.

FIRE.

BISHOP'S STORTFORD.—Damage estimated at over £30,000 was caused by a fire at a large timber yard and sawmills.

TRADE NEWS

Paint Post.

Have received the August number of "Paint Post," published by the National Association for the Preservation of Property (by hand and varnish). The N.S.P.P. has three objectives, viz., to spread the painting trade more equally over the whole year and to eliminate the depression in the winter months, to influence councils to pay greater attention to the protection of property, and to direct the attention of many classes of manufacturers to the importance of paint and as distinct selling assets for manufactured products.

Morris Hoist-blocks.

Have received from Messrs. H. Morris, Loughborough, a copy of their latest catalogue, illustrating the electrical hoist-blocks in which they specialise. They claim that their latest machine handles thirty times an electrical cost of one penny: at the rate of saving, we should imagine, the initial cost is soon repaid, while, in addition, the user has the satisfaction of knowing that he has a reliable, lasting and easily handled lifting service. Those interested should refer to Book 81 for full particulars.

Messrs. The Windsor Brick and Tile Co., who are in the manufacture of concrete products, announce that they have secured the right for all the red facing bricks and a large quantity of grey bricks for use in the 58 new houses which are to be built for the Windsor Corporation.

Mr. I. G. Blakemore has taken temporary residence at 180, Piccadilly, W.1 (Telephone No. : AR 8263), where he is organising an agency in connection with machinery, plant and materials of interest to contractors, builders, civil engineers and quarry owners.

THE SCOTTISH BUILDER

NEW BUILDINGS IN SCOTLAND

Dunbar.—EXTENSIONS.—The Town Council has adopted the scheme by Mr. J. Jamieson, engineer to the Edinburgh Corporation Gas Department, for the development and extension of the gasworks.

Buckie.—HOUSES.—Forty-eight houses are to be erected by the Town Council under the Wheatley Act. Each house is estimated to cost £300, which is claimed to be the cheapest in Scotland.

Rothsay.—IMPROVEMENTS.—The Town Council has agreed upon a scheme of esplanade improvement at the east side of the town between Albert Pier and the point of the shore opposite Glenburn Hydro. The pavement on the seaward side is to be widened and a dwarf retaining wall to be built.

Renfrew.—HOUSES.—The Dean of Guild Court has passed plans for 60 houses in the Moorpark district of Renfrew.

Forres.—BATHS.—The T.C. has decided to instal public baths in Forres House.

Cupar.—ADDITIONS.—The Dean of Guild Court has passed plans for the addition of two cloakrooms to the Sunday School Hall of Cupar St. James's Episcopal Church in Castle-street. Mr. C. Storrar is the architect.

Thornliebank.—HOUSES.—The Calico Printers' Association has just leased three acres of their land in the village to the Upper District Committee of Renfrewshire, who have prepared a scheme for 44 houses.

Dunfermline.—FACTORY.—The Dean of Guild Court has passed plans presented by Messrs. Gessner & Co., Zurich, Switzerland, for the conversion of a store at Castleblair Works, Dunfermline, into a hostel for their employees.

Edinburgh.—VARIOUS.—The Dean of Guild Court passed plans: Edinburgh Association for Women Students' Hostels, for two large hostels in East Craigmillar Park, Suffolk-road; mission church and class-rooms, in Fountainbridge, in connection with St. Cuthbert's

Church; James Moncrieff, seven houses at Granton-road; bungalow at Traquair Park, Corstorphine; St. Cuthbert's Episcopal Church Trustees, church hall.

Cupar.—FACTORY.—The Town Council has adopted the proposal of the Anglo-Scottish Beet Sugar Corporation, Ltd., to erect a sugar factory, and resolved to assure the Corporation that they will do everything in their power, by way of providing housing.

Coatbridge.—DAIRY.—The Dean of Guild Court has passed plans for a dairy factory at Dunbeth-road, for the Coatbridge Co-operative Society. The estimated cost of the building is £9,000.

Obituary.

The death occurred at Cambuslea, Ayr, recently, of Mr. J. Bryce, public works contractor, at the age of sixty.

Glasgow Slum Clearances.

Councillor Welsh has given notice to the Housing Committee of the Glasgow Corporation that he will move a motion for the suspension of slum clearance operations, and for proceeding with the building of more houses.

Director of Housing Retires.

Sir J. Walker Smith, the Director of Housing at the Ministry of Health, is to retire at the end of this month, and with his departure the office of Director, which was created in 1919 in order to deal with the acute problems which housing conditions then presented, is to be abolished. His valuable services to the State in this appointment were recognised in the recent birthday honours. Amongst other posts Sir J. Walker Smith has occupied those of City Engineer of Edinburgh, Controller of Housing with the Scottish Board of Health, Government representative on the Board of the Scottish National Housing Company, and consulting engineer to the Scottish Road Board.

It is stated that he has accepted an administrative post in connection with the National Federation of Building Trade Employers.

BUILDING TRADE WAGES IN SCOTLAND.*

The following are the present rates of wages in the building trade in the principal towns of Scotland. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

OCTOBER 2, 1925.

THE EAST KENT SURVEY

FROM time to time we have urged the importance of handling the East Kent area with foresight and vision from the outset, so that the muddle and squalor that we usually associate with coalfields might be avoided. This Regional Survey* is an est that the authorities are alive to their responsibilities, one can only hope that the coalowners, the landowners, the miners will co-operate in a constructive spirit to it effect.

This preliminary survey is unusually exhaustive and the ors have been fortunate in securing advice and opinions many among the foremost experts in the technical ques- that arise. The Report is divided into two parts, the roughly speaking, dealing with the area as it exists, the and sketching out future possibilities. The problem pre- must be among the most interesting ever handled by wn-planner, and is unique, certainly in this country, in this does not demand the usual disentanglement of a tic system of services, but represents a complete change an area of agriculture and seaside resorts to one in which ain factor will be the coal mine, while it demands, at the time, the most careful protection for a group of ancient iments and mediæval villages that are unrivalled in and. In the words of the Report: "If coal is to be ed and its attendant industries to be encouraged, they not domineer over the countryside or the sea-board; the h resorts, the villages and even the general aspect of the ry must not be damaged." It is comforting to note that onsidered opinion expressed in this Report is that, given and unrelenting vigilance, there is no reason why commerce d not be harmonised with the existing amenities of the ct, and Kent is apparently capable of supplying four the amount of power at present used in London and still enough for local industries as well.

he area concerned is contained, roughly speaking, in the gle formed by Dover, Canterbury, and Ramsgate; Canter- fortunately, falling just outside the actual coal area. ountour plan shows a high ridge running from just north ver towards Canterbury and falling gradually towards the t-east—the low-lying land that skirts the island of Thanet. ainfall follows the contours, and ranges from 35 in. on ver hilltops to under 25 on the low land, while the island eppey, towards the north-west, has the astonishingly low e of less than 20 in. The great bulk of the area falls within isdiction of the Rural District Council of Eastry, with eadquarters at Sandwich.

hen compared with the rest of England, this district has e been free from any acute shortage of houses, but, natur- the existing provision of houses would be quite inadequate uch the increase in population that will immediately result e the arrival of the miner and his family, and it is in the estions put forward for the future that the interest of the rt chiefly centres.

he first recommendation is that housing schemes should be ed, whenever possible, above the 50 ft. contour—statistics g shown this to be the healthiest area—and on no account e the 12 ft. 6 in. contour. Industrially, each coal pit l form the centre of a zone occupying a circle with a radius

of about half a mile within which no houses would be allowed excepting such as would be required for pit needs and watch- men, for which purposes about fifty would be needed in each area. Other independent factory areas would also be scheduled in convenient situations. The coal pits would be worked by electric machinery, instead of through the old-fashioned steam boilers and furnaces, and it is gratifying to note that the firms engaged have already agreed to adopt this method. The absence of smoke and chimney shafts will be the outstanding signs of progress, and the sooner the derelict shafts that have already been dotted about the countryside are pulled down the better. It will be through the presence or absence of chimneys and smoke that the public will judge whether the Kent coal firms have really "made good," and whether they are to be welcomed or looked upon as destroyers.

The selection of a coal port remains at present in the air, but it is recommended that whatever harbour is selected it should be capable of expansion up to the limit that could be required for the full export output of the coalfield and to allow for the exportation of the ironstone which lies in the southern part of the area. The ports that suggest themselves are Sand- wich (known also as Richborough), Deal, and Dover; but each of these would require heavy expenditure to make it suitable as a coal port.

As regards population, the figure is taken as 10,000 persons per pit; this will mean an increase in the population of about 280,000, or doubling the present population of the area. This increase, it is suggested, could be housed principally in eight new towns, containing an average of some 18,000 people each, and in addition to existing towns, such as Canterbury, Deal and Dover. Communications and transport, water supply and drainage are examined, and a great scheme of electrical develop- ment is outlined. The difficulty here appears to be the pro- vision of a sufficient supply of water for direct cooling purposes in Kent, a supply that exists in London, and that might mean the transportation of Kent coal for conversion into electricity in London.

To enable the project to be carried through, it is recom- mended that the following five means should be introduced, each of which is regarded as essential:—

- A. A Regional Plan and Regional Committee.
- B. Local Town-planning Schemes.
- C. A Development Company or Public Utility Society for the new towns.
- D. An Advisory Committee or Civic Society.
- E. An Advisory Art Committee.

The future of Kent is of more than local interest and im- portance. It is England's front garden, and it represents all that is beautiful and most to be cherished in amenity, archæ- ology and architecture; for this reason it is urgent that the scheme should attract wide attention. It is fortunate, indeed, in being sure of the support of powerful local bodies and interests; but whether it goes through as here outlined, or whether material modifications have to be introduced, is immaterial compared with the urgency of getting something done with the minimum of delay and the maximum of vigilance and foresight. The authors and all concerned are to be congratulated upon a very well thought out and a very practical first step, and the next step will now be awaited with interest.

* East Kent Regional Planning Scheme: Preliminary Survey." Erick Abercomby and John Archibald. (The University Press of ool and Hodder & Stoughton, Ltd., London. 1925. 10s. net.)

NOTES.

Another Society of Architects? ARCHITECTS and surveyors are being circularised on behalf of a projected organisation styled "The Incorporated Association of Architects and Surveyors." It is to comprise three grades of membership, namely, Fellows, Associates and Students, to be admitted only after examination, and its alleged object is to afford protection to those professional men who, if they remained unorganised, might, under a future Registration Act, be precluded from practising as architects or surveyors. We observe that the Association holds out the bait of membership free of examination to those who agree to join at once. But later on, when the examination system is in full swing, what advantages are to be obtained beyond those offered by the Royal Institute of British Architects, or the Surveyors' Institution? Moreover, it is not, we think, expedient that either of the professions named should be represented by more than one organisation. The spectacle of rival associations each claiming to represent the same profession is not calculated to inspire public confidence in either. The Institute and the Society of Architects endorsed this view when they agreed to form the recent amalgamation.

London's Housing. TOWN-PLANNERS and those concerned with the evils of overcrowding in urban areas have had the difficulties in the path of progress forcibly brought home to them by the inquiry into the conditions in Limehouse, which has now been concluded. The owners naturally protested against the proposed demolition of their property—this was to have been expected. But the remarkable unanimity of the tenants in their disinclination to accept any change has come as a revelation to most of us. The "back-garden" industries peculiar to the district have much to do with it, but those who got a living in this way appear to be in a minority. Even those whose work lies far outside the area in question have stated in no uncertain terms that their attachment to the houses, however dilapi-

dated, in which most of them have lived for so long outweigh any advantages which can be claimed for flats. What their attitude would have been if small houses had been offered we do not know, for apparently this alternative was not suggested. The Londoner's liking for a home which is all his own seems to have been disregarded, and this is perhaps the most striking fact revealed by the inquiry. In districts already overcrowded it is, of course, impossible to create wider streets and open spaces and at the same time accommodate the same number of people except by housing them one above the other, but in the twentieth century the prejudices of the people concerned have to be regarded. The only alternative is the formation of satellite towns, to which both industries and workers can be removed to healthier conditions, but London's Metropolitan Borough Councils cannot by themselves and individually carry out such schemes. This inquiry again suggests the desirability of a central authority to co-ordinate the housing policy in London, so as to prevent the dissatisfaction which is bound to arise in cases where a Borough Council cannot offer anything except flats to those who have to be dispossessed to make way for desirable improvements or the clearance of insanitary areas.

Unity Among the Operatives.

WE are glad to note that the National Federation of Building Trades Operatives, at their conference at Nottingham, passed a resolution asking the executive to make a serious attempt to get back into the Federation the bricklayers', masons' and plasterers' organisations which seceded a few months ago. As we recently pointed out, the National Federation alone, as now constituted, that is, without representing these important trades, cannot hope to conclude satisfactory agreements for the whole of the industry. Neither can the employers' organisation be expected to ratify agreements which are not binding on all branches of the industry. It will be to the benefit not only of the building operatives, but of the nation at large, if their interests can again be looked after by one body able to speak with a united voice.

Foreign Competition in Building. FOR the sake of our industries and workers are glad to see that scepticism regarding report that German-made concrete were to be imported into Ireland is fied. A representative of the Irish State Government has now stated that it is to be imported by Messrs. of Bremen (who have secured a £10 housing contract for the Dublin Municipal Council), is the shuttering, and the only foreign labour to be employed be limited to a few supervisors experience in the special system of concrete construction which the firm proposed to use. This bears out the surmise with a knowledge of Messrs. K special method of construction, forwarded in our issue for September. Foreign competition in building construction would be such a serious thing for our own industry if they were able to undercut prices that it is of interest to note the case of three other equally housing schemes for which this tendered in the Irish Free State builders were able to submit lower and secure the work.

Employers and Employed.

WE quoted last week sound observations by Thomas Barron on the moment as between employers and operatives in the building industry. We here detach two of Mr. Barron's remarks. It was the first and a popular one, at such conference that (the Conference of the National Federation of Building Trades Operatives) said Mr. Barron, to engage in a denunciation of employers, capitalists and such like, which, although doubt gave them much immediate satisfaction, gave them little else might be more profitable, if pleasant, therefore, to examine their own defects, and to suggest a remedy for them. If the workers in the building industry believed what they said they declared that they could run the industry without the employers should seek to equip themselves for the task. The nature of the industry such that it could most readily be what every industry ought to be, an instrument of public service at the moment the workers were ready. could only be made ready by preparation and by equipping themselves, not by the necessary preliminary study of Karl Marx and later economists, but by the actual and well-grounded knowledge of the science of running an industry. Political knowledge was good, but alone would not fit them to take that or any other industry. Their ability enough, if scientifically equipped and if full of zeal for service, to enable them to transform this ancient industry from a mere profit-making and paying business into a great service."

Plaster Relief in the New Gallery Kinema, Regent-street, London.
MR. FREDERICK LESSORE, Sculptor.

Plaster Relief in the New Gallery Kinema.

"As workers," he continued, "they had a responsibility for the provision of houses which they could not shirk, amount of sophistry as to its due to capitalism or any other would excuse them. Even the profit was being made out of need must not deter them from their service. The greatest word in the supersession of the profit by the idea of service which it takes would be their determination on the part of workers to spare no effort of task until every family in the shrouded under conditions of decency. He appealed to every one to consider how far he could go in this matter, even at personal cost it would be worth while if by so doing they not only succeeded in meeting the needs of their own folk, enabled to convince the doubting that it was possible to run an industry for private gain, but for the only reason really justified its existence, that it was performing a great service to those who needed such service."

It is not often that the R.I.B.A. Galleries contain so interesting and effective a display as now that they are filled with decorative pictures by Mr. Reginald Pictures which are really and displayed in so decorative a seldom seen in our galleries. The word has carried out a great of admirable painted windows, of his cartoon designs for shown; it is only to be regretted that examples of his actual glass could not have been exhibited so in sense of colour values might be seen. Some of his attractive panels of painted glass might have been shown. The poetic of the artist's work should appeal to all.

THE limitations on architectural design which so often result from an endeavour to obtain satisfactory acoustic conditions in an assembly or concert hall are considerably reduced by the developments in electrical science.

Some two or three years ago we predicted a useful future for wireless amplifiers in improving the acoustics of buildings, and since then amplifiers have been installed in the assembly hall of the League of Nations' building at Geneva and the Senate at Washington, with satisfactory results. Now the House of Lords is to be improved in the same way. Broadcast amplifiers will be concealed under the floor, and the benches furnished with headphones on handles.

A Trade Training Experiment.

WE hear that an interesting experiment in building construction is being carried out in the United States. The Hampton Normal and Agricultural Institute is established for the education of men of the black races. Mr. Whittemore Brown, who was recently in London, reports that he is in charge of a special course of building construction at the Institute and has been in touch with many of our prominent contractors in this country with a view to making the classes as up-to-date as possible. The aim of the course is to train the negroes to appreciate good architecture and to have a sound structural sense. A thorough training in one building trade—usually in carpentry or bricklaying—is given. It is found that after this they take up the other building trades very readily so that they are in a position to supervise building contracts intelligently. This course for helping men to equip themselves to fill the higher positions in the building industry has been brought to the notice of our British Board of Education, and it is possible that there will be developments on these lines in some of our technical colleges.

Plaster Relief in the New Gallery Kinema.

Our Exports. So yet another of our national monuments, Warwick Priory, is to be exported to America. It is good to know that it will be carefully re-erected and looked after, though this is small consolation to those in this country who cherish beautiful specimens of English architecture. We are told the building is being removed "for the benefit of the English-speaking people in America"; whether they will appreciate it in its new setting we do not know—certainly we shall miss it.

"One Touch of Nature."

BEHIND the grim realities of life there lie sentiments of human kindness which occasionally come into the limelight of publicity, and such was the case in a court of law the other day when an architect, Alderman Gunton, gave a light sentence in his magisterial capacity and helped the offenders against the law by paying their fines himself. He gave as a reason that he was pleased to find that the delinquents were willing to work and their trouble was caused by their not finding the promised work ready.

Rent and Rates.

MAY we ask one question of those who advocate rent strikes? "If the rent is withheld and the landlord's income ceases, who is to pay the rates necessary for the carrying on of any local services at all?"

A READY-MADE decorative picture of aircraft service appeared in *The Times* recently, showing the action of a 16-pounder. Photographs such as this should be translated into permanent records of artistic history.

Town Planning and Oxford.

THE town-planning problems of the day are many and serious, and one is now presented to us in the case of Oxford and the future of the area now being cleared on the east of St. Aldate's, between Christ Church and Follybridge. The future of Oxford cannot be a purely local affair; and it is to be hoped that the Council will take a broad view of the possibilities for further enhancing their beautiful city.

GENERAL NEWS

Change of Address.

Mr. William J. Fitt, L.R.I.B.A., has transferred his office from 11, Bolton-street, Piccadilly, W. 1, to 126, Bishopsgate, E.C. 2.

Mr. Hamilton H. Turner, F.S.I., has removed to 19, Queen Anne's Gate, S.W.1. Telephone No.: Victoria 2015.

Salonika Fair.

The Department of Overseas Trade is informed that the opening date of the Salonika International Fair has been further postponed until May 15, 1926.

A Stronger Steel.

A German newspaper recently published details of a new process of producing steel invented by a Swiss named Bosshardt. The new steel—which is to be called "Freund steel"—will, it is claimed, admit of a saving of 40 per cent. in weight and of 30 per cent. in cost for constructional purposes.

Epsom New Grand Stand.

Plans have been prepared by direction of the Epsom Grand Stand Association for the building of a new grand stand that will hold 20,000 people. The scheme will involve the demolition of the present buildings together with Barnard's stand on the right and Langlands Number 1 stand on the left.

Structural Engineers' Examination in India.

The Institution of Structural Engineers has, in response to repeated requests, made arrangements to hold the December Examinations for Graduateship and Associate-Membership in Bombay, India, as well as in the usual English centres. Intending European or native candidates should communicate with Mr. H. Foster King, Chartered Bank Building, Fort, Bombay.

University of London, University College.

On Monday and Tuesday, October 5 and 6, from 10 a.m. to 1 p.m., students of the Bartlett School of Architecture will be received by the Senior Tutor, Professor Richardson. On Wednesday, October 7, at 5.45 p.m., the students of the evening courses in Architectural Design and of the Architecture Atelier will assemble for the coming session.

Liverpool Architectural Exhibitions.

An exhibition of prize drawings by students of the Liverpool Architectural Society will be on view at the University School of Architecture, Ashton-street, from October 7 to 17.

An exhibition of work by the late Adrian Berrington will be held in the Society's Library at 13, Harrington-street, from October 12 to 23. All etchings and other drawings exhibited will be for sale.

Sulgrave Manor.

Mr. and Mrs. A. W. Weddell, who are at present visitors in London, have recently expressed to the authorities of the Virginia Historical Society, at Richmond, Virginia, their desire to build at Richmond a replica of Sulgrave Manor, the ancestral home of the Washingtons. The authorities of the society have accepted this offer, and Mr. and Mrs. Weddell are now with their architect making a study of Sulgrave Manor, as well as other and larger Jacobean houses.

A Malta Monument.

The Maltese Government has decided to place a commemorative statue in the principal piazza of the capital facing the High Courts of Justice. Mr. Antonio Sciortino, head of the British Academy at Rome, is the sculptor who has been selected to carry out the work, which, according to his sketch models, will take the form of three life-size figures grouped to form a symbol of Fortitude, Victory, and Thanksgiving mourning for the dead.

Proposed Manchester Tube.

The proposal for an underground railway at Manchester was discussed at a recent meeting of the North-Western Section of the Institute of Transport. A comprehensive scheme for

linking up various parts of Manchester by means of subways has for some time been before the City Council, and has been debated. with the result that a Corporation committee is now investigating the possibility of introducing the Tube system.

More Dublin Houses.

The Ministry of Local Government has sanctioned the proposal of the Dublin Borough Commissioners to raise £500,000 for the provision of houses for the working classes.

Bridlington Spa Reconstruction.

The Spa Committee at Bridlington has decided to call in the services of Messrs. Blackmoor & Sykes, architects, Hull, in connection with the £50,000 reconstruction scheme.

Proposed Catholic Churches.

The Guild of Our Lady of Ransom propose to find the funds to erect a Catholic church in every diocese of Great Britain.

Wembley Housing Exhibit.

The Ministry of Health invited representatives of fifty local authorities to inspect the exhibit of housing methods and building materials at Wembley, on Wednesday. A report will appear in the next issue of *The Builder*.

Town Planning.

In view of the general importance of town planning not only to local authorities and their officials, but also to private interests concerned in the development of land, the part of the Annual Report of the Ministry of Health for 1924-1925, which deals with this subject has been published separately. The report contains a statement not only of the position of town planning schemes throughout the country at the end of the year and of the progress of regional planning, but also of the attitude of the Ministry on a number of points of general importance which have arisen in connection with town planning and with appeals relating to proposed developments. Copies of the publication may be purchased, price 6d., directly from the Stationery Office at the following addresses: Adastral House, Kingsway, London, W.C.2; 28, Abingdon-street, London, S.W.1; York-street, Manchester; 1, St. Andrew's-crescent, Cardiff; or 120, George-street, Edinburgh; or through any bookseller.

CORRESPONDENCE

[While we are glad to publish letters on professional and other matters of interest to our readers, it must be understood that we do not necessarily endorse the remarks of correspondents, who will oblige us if they will express their views as briefly as possible.]

Lowest Tender Not Accepted.

SIR,—With regard to "A London Firm's" letter on this subject in your last issue, we tendered for a church school in a quarter of London, and were lowest by £3. The council accepted another tender. We sent an account for the usual charge for measuring, etc., but this was returned unpaid by the chairman of the council. We then wrote to a prominent firm of surveyors to say that if the matter was not adjusted they could take our name off their list of builders; they chose to do the latter. There is apparently no means of redress. The church council sold their principles for £3. Would they have done so if the difference had been 25 per cent. instead of a trifle of under 1 per cent.? Probably not.

"ANOTHER SUFFERER."

SIR,—We read with interest the letter from a London firm regarding the acceptance of tenders other than the lowest in private competitions. We have found recently several such instances, and we think in invitation tendering, the builders invited should have some guarantee that the lowest tender will be accepted. Could not some combination of builders approach architects with this end in view?

A PROVINCIAL FIRM.

COMPETITION NEWS

Cookstown Technical School.

Cookstown Technical Instruction Co. invite architects to submit plans for technical school, to be erected at Cookstown, Co. Tyrone. Full particulars may be applied to Mr. R. C. Burke, Technical School, Cookstown, to whom designs should be sent not later than Thursday, October 2.

Houses, Moor Park.

Moor Park, Ltd., invite contract builders to submit designs of houses to be erected upon the Moor Park estate in accordance with the details of the competition, full particulars of which will be sent on application to Moor Park, Ltd., Moor Park, Herts. The prizes are: first, £100; second, £50; third, £25. [We suggest that the promoters of the competition should invite designs from architects.]

Maternity Hospital, Leeds.

The design of Mr. G. W. Atkinson, Leeds, for an extension of the Maternity Hospital in Tyde-terrace, has been selected as the first place. Mr. R. Burns Dick, Leeds, was the assessor.

Competitions Open.

Newcastle Fire and Police Station. Premiums: £500, £300, £100. Mr. P. S. Worthington, F.R.I.B.A., Assessor. June 12.

Town Hall, &c., Pretoria. Open to architects residing in South Africa or Registered under Architects' Act, of 1909, Transvaal. Assessor to be appointed by R.I.B.A. Premiums: £250, £150, £100. April 24.

Argentine Institute. Premiums 10,000, 6,000, 4,000, 3,000, 2,000 gold pesos. Apply parties, 35, Old Queen-street, S.W.1. Aug 7.

New Buildings for Liverpool College, Mossley Hill. Sir Giles Gilbert Scott, R.A., Assessor. Premiums: £500, £300 and £200. Apply to J. H. Lintern, Secretary, Liverpool College, Sefton Park-road, Liverpool. Aug 14.

Australian War Memorial, Canberra. Open to architects of Australian birth. Apply High Commissioner, Australia House, Strand, London. Jan. 2.

Plan for construction of Conference Hall, for League of Nations, Geneva. International Competition, Sir John Burnet being British representative on Jury of Assessors. 100,000 Swiss francs to be divided among architects submitting best plans. Programmes will be deposited in due course with R.I.B.A., 9, Conduit-street, where intending competitors should apply. Single copies from Secretary-General, League of Nations, Geneva, on payment of 20 Swiss francs.

* Competitions when "warned" or "warned" R.I.B.A. are starred.

MEETINGS

MONDAY, October 5.

Society of Engineers.—Major V. A. son on "Bridges: Their Renewal in France During the Great War." House, Piccadilly, W.1. 5.30 p.m.

TUESDAY, October 6.

Institution of Heating and Engineers.—Autumnal General Meeting, Caxton Hall, Broadway, W.1. 7 p.

THURSDAY, October 8.

Victoria and Albert Museum.—Weekly on "Posters." At South Kensington, S.W.7. 6 p.m.

Resignation.

Mr. E. H. Harbottle, Devon County Council, has resigned his appointment.

Design for Bank Premises, London.

PROFESSOR C. H. REILLY, Architect.

EVOLUTION AND REVOLUTION IN DESIGN

By J. HEMBROW.

THERE is in architectural circles and amongst partly-informed but interested lay thought a tendency to restlessness, impatience and revolt against the wise restraint which respect for tradition imposes upon the anarchially disposed in design at the present time. We sincerely hope we shall never find architecture in the position of the worlds of painting, music, poetry and sculpture, which suffer from the fact that obscure hideousness is so often blatantly foisted upon the public by a few ruthless fanatics who have the presumption to assert that their impossible noises, their ill-drawn abortions, metreless balderdash and chiselled frightfulness have divine qualities which it is beyond the brain power of the ordinary public to comprehend—it is merely "Dadaism" without the honesty of the "Dadas" frank buffoonery.

It is folly to call at once for a new style as many are doing now—a new style cannot be created in a day, any more than it can be avoided when it comes. All true progress, whether it is the progress of design, the development of science, or the rise of life from the primordial slime, is gradual, and each graduation is based on what has gone before—the stag did not spring from the amphibian in one step, nor was the horse created as an improvement by any sudden futurist of nature. Such departures from nature's stately step are called freaks—nature destroys them and they should be destroyed.

We have all endured instances of the architectural futurists' efforts towards wilful "Bolshevism"; fortunately they have always stultified themselves. Whether it is that

special hideousness (we mean hideousness that is studied, not the every-day frightfulness of the speculative builder) is so readily observed that it is early recognised and sometimes obliterated, we do not know; we hope it is so. In any case, except in the matter of *l'art nouveau* which flourished longer than was comfortable or good for us, we do not remember when we have suffered further than by extremes in fashions and styles—which is, of course, the old danger of the vogue—a danger that we are just as much open to in this generation of Renaissance as our fathers were during the Gothic revival, when some of the most hideous things this country has ever suffered were put upon her good-natured face.

In point of fact, the present revival of Renaissance and the developing treatment of it, adapting it to modern needs, is hardly so much a fashion as a judicious selection of the style best suited to our present needs. The columniated treatment so much used for banks at the present time is not a mere selection by architects from the great styles; it reflects the fact that the greatest light area combined with solidity and dignity is obtained by such a treatment, and the reason for its adaptation to business premises is largely the same. This country has poor light values, and therefore glass area is of enormous significance. No other style gives the same opportunity. Anyone who has been in a warehouse affected by the well-meant enthusiasm for Venetian Gothic of Ruskin will appreciate this. There is generally artificial lighting all day. The architects forgot, as Ruskin forgot, that Venetian light and English light are rather different.

If those who are crying out for something new cannot find consolation in what we consider to be the very healthy state of design in this country to-day, they may, if they care to do so, look upon the source of the next development and trace how it is gradually affecting architectural style. If they are young or middle-aged it will be quite possible that they may see the passing of the transitional period in which we are now, and the first flowers of the new style which is bound to evolve. It will come—we cannot prevent it; we shall only delay it by attempting to attain it by revolution. But when the new style comes we think it will have possibilities for beauty beyond what we at present enjoy. We shall have a new instrument in our orchestra of design—we refer to the plasticity of concrete

and its capacity, reinforced, for tension as well as compression. If the restless ones consider the results of the use of concrete in design of bridges and one or two other uses, particularly buildings and towers, the strong, flowing lines rendered possible

comparatively new material, they will where to look for the nucleus of the change. Even now it has been used in theatre—and its masters are feeling their towards its ideal treatment.

concrete will definitely affect our design in future. The Greeks used post and lintel, Gothic and its forbears the arch—these all styles hitherto depended for tension on wood and iron. Now we have a material suitable for both stresses, and design will inevitably alter—is being altered now. Its change will be slow. Like the rise of animal from its early forms, it will move step by step from one proved stage to another. Sudden unformed spasms of effort will be treated by nature as nature treats her sports and abortions; they will be ignored or trodden out. That should aim at development and progress must agree, but let us proceed cautiously, avoiding the errors that our fathers made and cast aside. We shall only be tripped by these if we dash to right or left from the straight and narrow path of true aspiration. It is evolution, not revolution, that makes for progress.

THE WORK OF MR. THOMAS J. CLAPPERTON

By T. P. BENNETT, F.R.I.B.A.

It is always interesting to follow the career of a sculpture gold medallist of the Royal Academy Schools. This Royal Academy distinction is perhaps the highest prize obtainable by a student of sculpture, and quite a number of the men who have secured the coveted distinction have proceeded to carve out careers which have brought them prominently to public notice.

Mr. Clapperton won the Gold Medal in 1905, travelled in France and Italy. Returning home, his first commission was in connection with the Mungo Park Memorial at Glasgow, for which he designed some semi-allegorical figures of African natives. These figures have an interest of their own, and though they may not, perhaps, possess extreme artistic interest, they provide very fascinating subjects in a direction more or less untouched by other men. A work of much greater merit was completed in 1914, when the figure of "Bishop Becket" was modelled for the Cardiff City Council.

This figure achieves considerable distinction, showing real ability in the massing and composition, and pronounced artistic feeling in the simple folds of the drapery and cloak, which give the figure so much dignity. Without departing violently from precedent, it manages to secure an individuality which raises it above the general level, and shows that its author is capable of great things in commemorative sculpture. At this time he also modelled two colossal stone groups for the National Museum of Wales, one named "Mining" and the other "Shipping." Of these, "Shipping" is perhaps the most valuable as a decorative composition; the general arrangement of the figures and the play of light and shade are equally happy. The broad treatment of drapery and detail makes them suitable for high positions in which they are placed, enabling them to carry the weight of the

"Shipping": Group on National Museum of Wales. (Portland stone).

architecture in an extremely satisfactory manner.

In common with most of the younger members of the profession, Mr. Clapperton's career was seriously interrupted by the war, but since returning from the Army he has executed memorials in Minto, Canonbie, Earlstoun, Shenley, and other places. Of these, the figure on the monument at Canonbie is an essay in the representation of the khaki-clad soldier, which secures distinction by considerable breadth and simplicity, and a sympathetic attractiveness from the general attitude of the figure, the expression of the face, and particularly the angle of the head. It is a cause of much satisfaction that this, and other soldier figures on monuments erected in commemoration of the war, have avoided the dullness and commonplace character of the khaki-clad soldiers which commemorate the South African war, and the figure on the

Canonbie Memorial should undoubtedly be placed on a high level.

Another very interesting soldier figure is that on the Mewburn Memorial in the Church of St. John Lee, Hexham, Northumberland, a group made for a private family, and for that reason, perhaps, having a softness of outline and suavity of handling which, while being more or less suitable for this type of memorial, causes a certain loss of vigour as compared with the memorial previously referred to.

Mr. Clapperton is at present engaged upon the Gallowshields War Memorial, a mediæval subject symbolic of chivalry.

Torquay Beauty Spot.

Torquay Town Council have decided to buy Stoodley Knowle Meadow for £4,000 in order to prevent its being sold for building purposes.

A New Insurance Building in the City.

In the design of the new building in Threadneedle-street, for the Eagle, Star & British Dominions Insurance Co., the peculiar irregularity of the site clearly indicated a vertical treatment, and the architects, Messrs. Gunton & Gunton, F.F.R.I.B.A., have adopted with success a Byzantine style of architecture. The plinth is in Cornish granite and the elevations are generally of Portland stone, with the introduction of a good deal of coloured marble for decorative details, especially in the form of roundels set in the wall face in vertical strips flanking the arches. The balconies at the first and sixth-floor levels are also decorated with coloured marbles. The tower portion of the building is crowned with a dome, which bears an eagle, carved and gilded. The roofs which project from the tower are covered with red Italian tiles.

In the interior, marble becomes of primary importance, many varieties being used in the entrance hall for walls, floors, chimney-piece and pilaster capitals. Other rooms, as well as the staircase, show a rich use of marble for interior decoration. The rooms of the directors

are on the second floor, and are panelled in mahogany. The other floors are chiefly devoted to offices. The general contractors were Messrs. Bovis, Ltd., and the following were sub-contractors: Steelwork, Messrs. Moreland, Hayne & Co., Ltd.; Italian tiles, Messrs. Ames & Finnis; Portland stone, Messrs. Nine Elms Masonry Co.; Cornish granite, Messrs. South-Western Stone Co.; stone carving, bronze eagles, and ground floor plaster ceiling, Messrs. H. H. Martyn & Co., Ltd., Cheltenham; marble work, Messrs. H. T. Jenkins & Son; heating and ventilation, Messrs. Nicholson, London; bronze windows, Messrs. Henry Hope & Sons; wrought iron and other windows Messrs. Crittall Manufacturing Co., Ltd.; electrical work, Messrs. Francis Polden & Co., Ltd.; lifts, Messrs. Express Lift Co.; floors, Messrs. Siegwart Fireproof Flooring Co., Ltd.

Sidney Sussex College, Cambridge.

This new block is a good example of the way in which artistic effect may be obtained with the least possible display of decoration. The Portland stone doorway arrests the attention

at once. It rules the whole, not ostentatiously but with a quiet assurance. The central of the elevation facing north is marked by sturdy yet graceful stone vases. These, with delicate roundels on the main door, are exterior ornaments. The building is of brick and Portland stone, the construction fireproof throughout. The one large staircase leading to all the 36 sets of rooms is a departure in college building, as is the method of heating throughout. Bath and lavatories are provided on each floor. There is one Fellow's set consisting of sitting room, a dining room, a bedroom, ante-room. Mr. T. H. Lyon is the architect. The builders were Messrs. William Sainsbury of Cambridge.

The sub-contractors were: Heating, Broadhurst Craig & Ching; concrete, Truscon (Messrs. Trussed Concrete Steel Co.); wood floors, Messrs. Stanhope Floor; asphalt, Messrs. Lawford & Co.; iron fittings, Messrs. Jennings & Co.; ironwork, Messrs. Nettlefold & Sons, Ltd.

Design for Bank Premises.

The drawings published in this issue are a competition design, by Professor C. H. for bank and business premises proposed to be erected at the corner of Albemarle-street and Piccadilly. Mr. Curtis Green, A.R.A., was the successful competitor, which was limited to five competitors, the directors of the bank acting as their own assessors.

Proposed House at Wimbledon.

The site of this proposed house, for Mr. Smith, is $1\frac{1}{2}$ acres, thus allowing the stand back from the road with its elevation facing north. Most of the offices are on this side, leaving the garden at the rear, unobserved by servants. The scheme is to a great extent by the sizes of the room, dining room, and best bedroom which had to correspond with the client's present house. Internally, it is a plain Georgian, to harmonise with Haskett-Smith's antique furniture. The walling is to be 2 in. purple stock with red sand-faced bricks, and a pantile roof. The estimated cost, including everything but garden work, is about £10,000. Mr. Geoffrey Fildes, A.R.I.B.A., is the architect.

Dundee Secondary School Competition.

We illustrate this week the design second in the recent competition for the Dundee Secondary School in Perth-road, Dundee. The architects are Messrs. MacLaren, Somers & Thoms. The first premiated design, by Messrs. Thoms & Wilkie, was illustrated in our issue of September 11.

PHILIP WEBB AND HIS WORK.—IX.

By W. R. LETHABY.

A WINTER IN ITALY. LETTERS.

(Continued from September 4.)

To Mrs. and Miss Faulkner:

Florence, November 26, 1884. My dear Friends,—. . . I have been much disinclined to write anything from my crowded head. I fancy that my head is more overwhelmed by the tongue in it being more or less disused; the good-natured Murray being the only one to whom I can remark anything either in jest or earnest. I left London on the 9th and went from Dover to Ostend, then to Bruges, Ghent and Brussels, all with Wardle as companion—a very good one, who watched me in the most kindly manner. I left his shielding arms on the 17th and travelled by night train to the St. Gothard Pass. From Basle and upwards there was snow, and complete winter up to the mouth of the tunnel. After starting out into the Italian side, I came into clear, bright sunshine again—another world with no snow. I came in the late afternoon to Lugano, my present good host Murray arriving there also about 10.30. Besides the quite lovely scenery of this Italian Switzerland and the pretty town there was one of the noblest frescoes in the world to see, in wonderful condition and as wonderfully lighted with perfect sun. We journeyed to Como and stopped, and then to Milan and stayed there, afterwards to this place on the 21st. Murray's home having many rooms, he has very kindly put at my disposal two in which I can be solitary after my manner and do some work. I shall not attempt to tell you of the wonders of the land. I confess to finding such a dim waste of glory and beauty at times really oppressive. You must not think that I do not enjoy the wonders, for I do so, but they are piled up and are apt to set me musing in a rather melancholy way. . . .

To Boyce:

Florence, November 27, 1884. . . . There has been too much to see and dream over for anything like friendly writing; added to which I was obliged to bring some work, and in Florence I had to take up that. It rather saves me from becoming moody under the impress of staring at the vast wreck of ancient art strewn over this country. Wardle went with me to Brussels, and now the good-natured [Fairfax] Murray, with whom I am staying, helps to temper wonders to my soul. I am driven to desperation by the multitude of things which cannot be passed by hastily. I thought to pay but general heed to pictures, but I find that they lay hold irresistibly. I was so caught in the net of a tremendous Luini fresco at Lugano on my first stepping into Italy that I have barely recovered from the surprise after more than a week. Murray is a fine sleuth-hound, scenting out many hidden things. I have been obliged to add to my business by taking some lessons, and the governess must have gone home with hands upraised at the stupidity of the English. If she had known enough English herself she would have cursed me surely. Sincerely the friend of both of you.—Philip Webb.

To Mrs. and Miss Faulkner:

Florence, December 7, 1884. My dear Friends,—I had your kind letter from the hand of Kate, dated November 29. . . . I liked Bruges very much indeed, and, I fancy, much as you did. Wardle and I were quite active in going about, and saw much. St. John's Hospital and the Jerusalem church impressed me most, perhaps, but the belfry was always a pleasure. Of course, I went to see the "Adoration of the Lamb," and luckily the guide went to his dinner and left us alone for some time. The pictures there and at Brussels were more than enough to get through with attention, but here they are by the thousand, and do what I may, many only just get looked

at, which is a shame, or would be if it could be avoided. I had two days at Pisa last week and found that place crammed in like manner. Like an embarrassment of friends, one has to pick out those most to one's heart and stiek to them, so I do with the pictures. To-morrow I go again to the Uffizi to try and lay hold of the greatest works there, but after all, the frescoes remaining on the walls built for them are most to my content. Consider an old building of the thirteenth and fourteenth centuries, all dreary and half forgotten, having the walls more or less covered with works of the time, and all the life that has gone on and been touched by these works for 500 or 600 years. This was the case in a church about four miles out of Pisa (San Piero in Grado) lying in the fields, only a farm-house adjoining it. A large old ghostly church of the thirteenth century, with the walls above the arches all covered with stories: the painting dim mostly and in spaces nearly gone, but yet wonderful in its diminished splendour. This church was not lighted up with bright sun, for it rained, but in spite of this gloom I got used to it and came away with regret. Pisa itself is also full of wonders, but they are almost deserted and neglected, except in the Duomo, where worse has happened in the way of scraping and touching up. Your description of going to the S.D. Federation gathering interested me much. It was the first news of active life at home that I had heard of. . . . What I have seen of the land in the plains makes me stare with amazement at the laborious care with which the tillage is carried on, labour on labour, so that the whole is as closely dealt with as a garden; indeed, the ground looks as if it were one vast garden, clean and tidy as such. This patient labour of man and beast is very touching to me. I think I know—or, rather, feel—what Ruskin means with his beating down of Shelley and raising up of Keats, for I have had some of the feeling of distaste for the former which I can hardly explain, except that I think Shelley wrote more from the head than the heart. I am sorry to learn that you have been somewhat sleepless, as that wears one away and leaves nothing in repayment for the waste. Take exercise, for I believe that air and exercise are the only help for such evil. I smile when I write this, thinking of my own determined opposition to any way but of my choosing. . . . Send Charles my love and any cheery word from me. I feel that it would take fifty years for me to be able to make even a bad joke in Italian. My last English was at Stanhope's grand old villa, half a mile from here, where I dined last Monday with Murray. The weather to-day has been quite foggy, so that when I walked into the middle of the town I could not see the top of Giotto's tower. Last Monday I went up to its top and saw a world of splendour all round. I made a note of the preparation at the top for the lantern stage which was never built and would have made such a perfect finish for it. I am intending to go into the construction of Bonnelleschi's dome, as that is very interesting from a builder's point of view. If you are in want of books, you had better go to Raymond Buildings. Mrs. Long would be glad to give you some tea. This would be an excuse for going out.

To Miss Faulkner:

Florence, January 3, 1885. . . . I went up to San Miniato on the first January, and as I was leaving gathered a leaf of the bay-tree or laurel proper, which I put into this letter to sweeten it. The great Michael Angelo, one of my dearest of friends, was very fond of S. Miniato, which overtops and smiles on Flor-

ence so little away from and yet so far bene it. As you look from galleries and of places in this city, you see, and say, "there is San Miniato!" almost as if you said "there is sweet old Michael." In his days he fortified the place, and the decay fortifications still remain as a home for v. plants. I had been on the morning of day to see again his marble work in its home at San Lorenzo in the city. You remember that I have small casts of two the figures [Dawn and Night] on my bo case. I was left alone in the Sacristy—called—for an hour or so, for though so came in to look they did not stay more t five minutes. The keeper came in once twice to see that I was not breaking off t (the statues') noses, but finding me t taking notes, he returned quickly to tell to put on my hat so as not to take cold, thus well earned a pinch of snuff, which took to kindly. I shall have some photogra to show you when I return which will quic the meaning of these few words. I thank for your news about the S.D. Fed.; and day came a long letter from Morris giv chapter and verse for the times he has b going through. It does not look all black me, for I see better light through the holes disruption—a deal of sifting *must* go on revolution times, as people are necessarily cepted as allies in all these movements w they must really be enemies. Even the D has his uses. The necessity of evil has b preached about often enough, but it is painful complaint, and the world is seam and scarred with the effects of the disease, day being bright and fine, in the morning went up into the dome of the Duomo on p pose to examine, as I had promised mys the construction of this great work of Bon leschi. I had before made myself acquai with its construction from books, so that knew what to look for when I got in betw the arched and ribbed shells of its mightin The work was well done, and therefore long as it stands it will be good to look. Of course, your own personal work has st still lately, but I am sorry to think of y being likely to have to part from your worl lad—must this be so? I suppose you ha however, got well on with the piano case, that when you take it up again it will quickly to its finish? I start Rome-wa about the middle of next week, I think, st ping at San Simignano, Siena, Orvieto, my way there, and this will take about week. I shall let Mr. Jack (at Raym Buildings) know my address as soon as know it myself, so if you should want to s any message before I again write, please s it to him. With my kindest love to mother, believe me very sincerely yo Philip Webb.

Also you will not forget me to Charles w you see him.

To Boyce.

Florence January 5, 1885. . . . You do v to attend at the Anti-scrape meetings as many of the half- or quarter-hearted mem take no interest. . . . I have seen Lug Como, Milan, Pisa, Lucca, Pistoja and Pr and I have worked away here pretty stead . . . The pictures are a great hindrance, many and so good that I have been unable resist looking hard and long. I had a b of fresh enjoyment over the Benozzo Gozz in the chapel of the Pal. Riccardi, and t took my breath away. . . . I can see that suffers less than others do who saw Flor 20 or 30 years ago. The loss of the wall immense. I have counted the towers and of wall remaining. . . . My work did fo me. I have done one fit and another m me in Rome, so that friend and assistant J at home be not too heavily taxed. . . . I s for Rome on Wednesday, taking Gemignano and Siena on the way. . . .

To Boyce.

Florence, March 5, 1885. . . . I only go Rome 2 days after the high flood of Ti

had risen after heavy rains. The water into the Pantheon, etc. I was there weeks, but most of my mornings I had to do home work; the days were short; ever, I was helped by friends, especially Middleton. After the Sistina, perhaps I most taken by the Pinturricchios in the Rooms at the Vatican. I did a good deal of walking round in the Campagna, and not throttled by the herdsman's dogs. My way back here I stayed at Assisi, Perugia, and Arezzo. After work time I have had out to refresh my memory of frescoes and engravings. The good and great Fra Angelico I think, never be forgotten. His work did surprise me in spite of what I knew of Giotto and M. Angelo I need say no more. The Pantheon was rather a surprise to the good, as St. Peter's was to the bad (speaking broadly). Even M. Angelo did not lick it into satisfactory shape. His library at San Lorenzo (the library) here much interested me. Middleton had to rush home to England. I am looking forward to his book on Roman antiquities. I got on well with him, and he is "a little creature to shoe behind." Mrs. Boyce's violets and Etampes are in front of me now. The cold was a bore, but the people enjoyed it which I was glad—and I could avoid the cold. . . . If your colds still stick to you get the fresh air!

Miss Kate Faulkner.

Rome, January 24, 1885. I have been here many days. Rome has been very cold indeed; fingers had to be thrust into pockets to keep them usable. I left Florence on the 7th and went to Siena, spent some 5 days there and found the place full of interest: a walled town, the streets all up hill and down dale, the middle of the place being on a hill and the hills which radiate like fingers. The cathedral and the town hall are the great things; the other churches, though noble in design, are mostly almost bare. The cathedral is extraordinarily full of work of a strange kind. . . . One of the chief delights of Siena is the number of large mediæval houses still standing. I went to San Gimignano, but only there long enough to see its strange and rude beauty. From Siena I went to Pistoia, a noble city on a rock high above the Arno, which soon runs into the Tiber. As the weather was stormy, and as the authorities had been blundering over their repairs of the cathedral, a considerable part of the cathedral was washed with rain; even frescoes being washed away. I am somewhat indurated against sight-seeing, but I confess I do not like to do so. I shall hardly be sorry when my time is up and I can pretend to earning an honest living, for as it is now—in spite of the work I feel somewhat of an idle man, living on the sweat of the labours of poverty. Rome is almost a terrible place; very wonderful and it has many beautiful things, but from its appearance the memories it gives me are a grim look. The place is full of the remains of palaces, both lay and priestly, and it gives me a devilish cast. I am most kindled by my friend Middleton, who is hard at work on a history of Rome, and as I live in a room on the same floor as his I pick up many interesting things. M. Angelo's ceiling of the Sistine Chapel in the Vatican is the most wonderful and comforting. The ancient ruins are wonderful, truly, but also terrible indeed. In Rome has shown what a curse he can be to himself. Just now I went for a walk in the Campagna and back by Tiber's side. The country, too, has a terrible look, softened and there by some grace of beauty. I think that the most gentle things I have seen are the happy jackdaws playing about in the streets and settling on the wind-vanes. These creatures have their myriad homes in the cracks and the ruined walls of the Colosseum and the places of the Cæsars. They make the place human with their active and clattering talk. If you write again,

after you have told me how you both are I should be glad to know how the new [Socialist] League is getting on. I heard from Morris just after the break up, and I should like to know if things are going pretty well in the new form.

To Miss Kate Faulkner.

Rome, February 7, 1885. . . . Morris said in his last letter that he would send me a "Commonweal," but as I have not yet had it, I fancy it may have been confiscated. Therefore, if you will be so good as to send me a copy in an envelope, I should like it. Next to my walks outside the city, a little way into the Campagna, and the looking into the old or Byzantine churches, I have not had such pleasure in Rome as my second going to the Sistina Chapel, where I stayed for about two hours. There were but few people there, so that the more real and familiar people on the ceiling came home to me. This great boon of M. Angelo's to the world is a triumph of art, imagination and beauty. I could live comfortably in this vast hall with *self and cat*, so noble and pleasant is the art. I find that three parts of the—so-called—splendid buildings of Rome are brutal in their magnificence, whereas this greater creation than all is to me as free from offence as a small, quiet room. I say "to me," for I find few in sympathy with me on this point. Raphael's extraordinary skill, artificial in an artificial time, commands attention and much futile gabble—I am quite sick of it. I have just been to the Villa Borghesi, where there are ancient statues by the hundreds, good and bad; but the building and marble decoration, etc., are so offensive that I was glad to get away, even from the good things, into the open ground about. which is really beautiful in its half-neglected but not ragged state. The garden (old park, rather) of great size are a boon to the Romans, as it is free to all for four days in the week, where they can roam about and gather flowers, which are many—violets making the now warmer air quite strongly scented with their own special scent. Jackdaws by the flock make a noise which is a comfort in this country, where the smaller birds are so killed down. After two or three tries, I at last got into the Pantheon, which is closed to the people on account of taking down of much theatrical rubbish, put up for the anniversary of the death of the late fat King. By dexterously putting my hand into breeches pocket, the custodie let me through the gate, and I was satisfied with wonder at the area and dome of this noted Roman work. It is really a quite impressive vault; comparatively low down, with a big hole in the centre open, and the rain coming in as it has done since the building was set up. This is the only light into it, and it is ample. The Italian Government had decided to cover this light with glass, but there was enough row made to stop them, so that the meaning of the building will so remain—yet awhile! The Italians are quite reckless in destroying the smaller remains of greatest antiquity in order to set up long rows of houses of a lofty Bayswater type—though I am bound to say, of not quite so bad a kind. I rather think, Kate, that you are in want of me, to tell you candidly, as I always do, what I think of your work; for I feel sure that from long, continued strain in doing so great a labour you are not able yourself alone to make out what it is really like. However, I shall not see it in its finished state, as I should so much like to do. It seems to me that such work as raising patterns with gesso must be disappointing to you, as to do it perfectly one would have to be brought up to it in a traditional manner; but I felt satisfied, and more so, in the way you had done it. Added to your personal disappointment, you should allow for all hearty workers being dissatisfied with the outcome of labour which has taken some time to do. You must comfort yourself by imagining what my houses look like to me when I see them

finished, or as nearly finished as the people who are to live in them care for. My comfort is in setting about another work to drive the taste of the former away. I shall, I fancy, be leaving here in a week or ten days; enclosed is an anemone gathered just outside the walls of Rome; it is a common wild flower here.

To Miss Kate Faulkner:

Florence, March 8, 1885. . . . I leave for Bologna to-morrow. I received the first number of "Commonweal" at Rome, and the second number here. I am deeply interested in the progress of this new venture, and no one except Middleton, whom I have seen, cares at all for such matters. I met a very pleasant Oxford man in Rome, Bradley by name, stepbrother, I think, of the Dean of Westminster, who did not dislike talking of Socialism. He is now a professor at Liverpool. Morris's poems were both a great delight, and I liked his tone compared with the rest of the paper, which I think rather weak—I suppose it must be so. I think I told you that Middleton had to rush home to England to his father, who was stricken with paralysis. I had a letter the other day, and he said he had been in Oxford and met Charles and Morris at Bywater's rooms. When I left Rome on February 19, I went to Assisi, a beautiful town pitched on a high hill. The chief church is a double one, one under the other, and both covered with paintings by Orcagna, Giotto, and other early Italian men. The church also is beautiful, and I was all busy during my stay in trying to understand what I saw. I went from Assisi to Perugia, the chief interest of which place is its Palazzo Pubblico; the churches also are fine, in spite of terrible transformations. . . . Arezzo—another hill town, but not so high up—had in its Franciscan church a series of frescoes by Piero della Francesca, a painter much to my mind. There are two pictures of his in the National Gallery. The chief, a Baptism of Christ, gives his characteristics very well—great purity and simplicity. Frescoes permanently beautify a building, whereas separate pictures become, too much, objects of mercantile exchange, of which over-reaching is the chief element. All noble framed pictures should be in public galleries. After Arezzo I came on here, where I have been at my home work. The spring is now showing, many things are quite green and the almond trees in full bloom. On sunny days one gets to the shady side of the street. . . .

To the same:

Venice, March 28, 1885. My dear Kate,—I never was a good letter writer, and here, between work of various kinds and natural indolence, I am too weak in the matter. I was greatly pleased with your note of the kind mother's being about again, it makes me ashamed to be away, as I should be at home helping all I could those friends who like to have such poor aid as a kindly face can give—My love to her. I left Florence on March 9. Bologna is a pleasant and still much of a mediæval town, mostly built on arches to the streets, so that one can walk about under vaulted cover. Ravenna is wonderfully interesting, but as a town poor, the only beauty being in the churches, which not only are old but have the air of very great age on their faces. Forlì is a pleasant place, but not of great interest. Of Venice, having heard much talk since I was a boy, nothing had spoiled it to me when I came to walk about its strange ways. I have been here a fortnight and am still untired. Added to the deep interest of its history, it is still very lovely to look at, and there being no wheels to trouble one (always extraordinary in effect), the standing about is so comfortable. To push or be pushed about in striking-looking boats is a never failing pleasure—everywhere some pieces of admirable architecture turn upon one. These are the gentler delights; the greater and more terribly lovely,

such as St. Mark's Church and the Ducal Palace, are always touching. I cannot say that I like travelling, after all is said, but Venice gives one less cause for regret that I am not at work. I have all sorts of vain regrets myself, but when I write to you I feel inclined to say that you must be of good cheer, as if only saying it should be enough to clear your way of anxieties. I rejoiced from what you said and from what Morris also wrote to me, that the meeting at Oxford, with Charles in the chair, was successful in spite of difficulties. I am so with our friends in heart that I blush that I can do next to nothing to forward the cause. However, I look to claiming my place with them on my return, though of so little strength for helping. A. C. Bradley, of Balliol, is here; I go with him to-morrow as far as Padua, and return here for a few more days. Murray came here, and he is now at work on a study of St. George, by Carpaccio, for me—memorial of a delightful work by a painter who pleases me so greatly. When I leave I go to Verona, to stay as long as my nearly ended time will allow. I did not smile when you told me the piano was not yet gone, as I felt quite seriously your wish to make it as perfect as you could—all art work should be done in that spirit. I shall hope to see it when the owner has it.

To the same:

Venice, April 4, 1885. I had your kind letter with the "Commonweal," and as it had two of Morris's things, I the more rejoiced. I am very anxious both for Morris and Charles, as they will both of them be very earnest in their labours, and neither of them wanted any added work. Still, there is a kind of obstinacy which one gladly puts up with in one's friends, even though they and we suffer by it. I leave here to-morrow for Vicenza, on my way to Verona for two or three days, after which I shall make my way to other towns and leave Milan on the 15th or 16th. I must not delay any longer getting to my home work. Venice I have found a pleasant place, as over and above its great monuments of beauty it has so many old houses that perhaps more of a mediæval town is to be seen here than anywhere. I need hardly say that the cold and formal architecture of the Renaissance looks duller here than in other places. Venice is also blessed with many pigeons, and they make alive even a stupid and pompous piece of building. The canals and shallow seas are also a continual pleasure, and the absence of wheel traffic a boon beyond comparison. Still, I do not really care for travelling, though I should be more ready if I knew the language; I like to speak to all I meet, the more so as I get older. I also wish to get back to avoid the daily reproach that my friends are without even my small backing in their efforts for the mass of mankind. . . . Bless me! After all, I may be able to see the piano before it goes from Queen's-square. I was at Padua the first three days of this week, and found it a pleasant city, full of streets built with arches on each side to carry the houses. I was lucky in having bright weather for the day I went to Torcello, which is a place all too sad. Its two strange churches stand side by side as if they were the last of the place, as very nearly they are.—Yours very sincerely, PHILIP WEBB.

The Sargent Exhibition.

Sir Frank Dicksee, President of the Royal Academy, speaking at the opening of the Liverpool Autumn Exhibition at the Walker Art Gallery, announced that a large bronze crucifix designed by the late John S. Sargent is to be included in the exhibition of his works at the Royal Academy in January and February, and it is hoped that ultimately a place for the crucifix will be found in St. Paul's Cathedral. The crucifix, which is 13 ft. by 18 ft. in size, is at present in America; it was designed for the Boston Public Library.

STRAITS SETTLEMENTS REGISTRATION

A MONTH or two ago the Institution of Structural Engineers protested to the Colonial Office against the provisions of a Registration Bill for the Straits Settlements which sought to preclude all who were not members of the Royal Institute of British Architects from carrying out any architectural work which, under local bye-laws, includes civil and structural engineering and surveying. The Surveyors' Institution, the Institution of Civil Engineers, the Institution of Structural Engineers and other professional bodies, registered similar formal protests. The Colonial Office has now offered one of two saving clauses. The first of these, in exempting members of various institutions from the provisions of the Bill, seeks to define the professions of civil and structural engineering, &c. The second saving clause to which the Institution of Structural Engineers has with certain reservations agreed is worded as follows:—

"... Nothing in this Ordinance shall be construed as debarring any person who is a Chartered Civil Engineer, or a Bachelor of Engineering, or a Bachelor of Science of any British or British Colonial University, or a member of the Institution of Structural Engineers, or a member of the Royal Sanitary Institute, or a member of the Institution of Mechanical Engineers, or a member of the Institution of Electrical Engineers, or a member of the Surveyors' Institution, or a member of the Institution of Municipal and County Engineers, or a member of the Institution of Mining and Metallurgy, from exercising his functions as a civil, structural, sanitary, mechanical, electrical, or mining engineer, or as a surveyor . . ." The Institution of Structural Engineers asks for these additional words to the last sentence above: "notwithstanding that these functions may include the submission of plans, &c., under the Registration Enactment." In bringing this matter to public notice, the Institution points out that, before any attempt is made to promote Bills for registering members of the architectural, engineering or surveying professions, it would be very much better for previous unity between various representative institutions to be arrived at.

REPAIRING ST. PAUL

The *Journal of the Society of Engineers* for July-September records a visit to St. Paul's Cathedral by a party of members, to whom works of reparation were explained by Resident Engineer, Lieut.-Col. C. E. Sankey, D.S.O. The machinery for m and injecting neat cement grout (it consists of an electrically driven air pressor, pneumatic engines for working paddles that keep the grout stirred, and the pump working by compressed air) pumps the grout into the holes at a maximum pressure of 50 lb. per sq. in. Pneumatic are used for drilling the grout holes. The positions of the grout holes are carefully selected, being in some cases as much as 16 ft. long, 1½ in. in diameter, in a nearly horizontal position. They slope slightly downwards, the object being that the final grout would be in by the action of gravity. The pressure for the grout varies from 20 to 50 lb. per sq. in. according to circumstances, and the holes on the opposite side of the pier are arranged so that they "break-joint" with the first. The grouting is started at the lower level of the piers in the crypt, and will gradually work upwards. After the grouting has been completed, the grout holes will be drilled out and reinforcing bars of metal of a non-corrosive quality will be inserted in the drilled holes and grouted up. Thus in the end the piers will not only be well grouted, but will be reinforced. The total weight on the eight piers, including their own weight, is over 60,000 tons.

NEW UNDERGROUND STATIONS

The illustration given below shows the type of station entrance and hall which has been decided on by the Underground Railways. It will shortly be built for stations on the City and South London extension. The design probably be adopted in all future station reconstructions. The architects are Messrs. Adams, Holden & Pearson, F.F.R.I.B.A., who are also designing the new headquarters of the Underground Railways at St. James Park Station.

The New Type of Underground Railway Station.

MESSRS. ADAMS, HOLDEN & PEARSON, F.F.R.I.B.A., Architects.

SCHOOL PROSPECTUSES

ARCHITECTURAL ASSOCIATION.

We have received the prospectus of the Architectural Association, which was founded 1847 for the purpose of promoting and providing facilities for the study of architecture. Its chief educational work is in connection with the School of Architecture, which is controlled entirely by the Council of the Association. It receives the support of the Royal Institute of British Architects and has a representative on the Council of that Institute. All students when entering the school become members of the Association, the membership of which includes most of the leading architects of the country and the majority of architects in London, who use the premises of the Association and take part in its affairs. The opportunity thus afforded to those commencing their architectural career in the school to come into immediate contact with the practical world of architecture is extremely valuable.

The course consists of five years at the school, after which the student must spend six months in an architect's office before being eligible for the School Diploma. This passed successfully, the student must pass the R.I.B.A. professional practice examination and spend a further six months in a builder's office before obtaining the Associateship of the Institute.

The social side is not neglected, there being tennis clubs, athletic clubs, etc. Full particulars of the Association are contained in the annual "Year," which may be had on application.

REGENT-STREET POLYTECHNIC.

The prospectus of the School of Architecture, Building and Surveying (Evening Department) of the Polytechnic, London, has just been issued: the session for 1925-26 commences on September 8. The syllabus includes the following courses: Architectural design and composition, practical geometry, building construction, land surveying and levelling, builders' quantities and professional practice, building law, valuation, etc. The Polytechnic Diploma and the Senior Grouped Course certificate are awarded to students reaching the necessary standards of proficiency. Sir James Fletcher, F.R.I.B.A., is the President of the School, and Mr. G. A. Mitchell, R.I.B.A., the Principal.

COLLEGE OF TECHNOLOGY, MANCHESTER.

We have received the prospectus for the opening session of the Manchester College of Technology, which commences on October 8. The University Courses offer systematic training in the principles of science and art as applied to architecture; mechanical engineering, sanitary engineering, the building trades, etc. The College possesses extensive workshops in which students can put to practice their theoretical training; in addition there are machines especially constructed for demonstration, experiment and original research. Students who, having passed the Matriculation Examination, or its equivalent, satisfactorily complete a three-years' Ordinary or Higher Course, become entitled to the degree of Bachelor of Technical Science.

WESTMINSTER TECHNICAL INSTITUTE.

In proximity to the many professional offices and around Victoria-street has rendered it desirable that to the Westminster Technical Institute should be assigned the function of providing technical instruction to young architects, surveyors, valuers, estate agents, constructors, and others engaged on the professional side of the building trade. Systematic and progressive courses of study extending over a period of years have been arranged, with the assistance of a highly

experienced and qualified staff of teachers. These courses are exactly adjusted to the requirements of the various classes of students, and extend from the instruction essential to the junior draughtsman to the specialised study required by the most advanced students. In the announcement recently issued by the Royal Institute of British Architects regarding the R.I.B.A. Statutory examination, emphasis is laid on the necessity for a careful study of the London Building Acts and of building construction. The classes at the Institute provide an opportunity for acquisition of the comprehensive knowledge of these subjects, in both their theoretical and practical aspects, requisite to success in this examination.

The Principal will be pleased to forward to intending students and others interested in the work of the Institute, copies of the prospectus, containing full particulars of the courses of instruction, syllabuses of work, and fees.

WILLESDEN POLYTECHNIC.

We have received the 1925-26 prospectus of the Willesden Polytechnic, the syllabus of which includes a day building construction course. Mr. G. Ayres, Inter.B.Sc., is the head of the course, which consists of a year's elementary building construction and mathematics, and a year's more advanced work; in addition there is workshop instruction in carpentry and joinery. There is also a plumbing and domestic sanitary engineering course, and a course of mechanical engineering. Readers interested should write to the Secretary of the Institute, Priory Park-road, Kilburn, N.W., for particulars.

ROYAL INSTITUTE OF BRITISH ARCHITECTS

Intermediate Examination, November, 1925.

The centres for this examination will be London and Leeds. At both centres the examination will be held from November 20 to 24 inclusive. At the London centre the oral examination will be held on November 24; at the Leeds centre on November 25.

Silver Medal for Recognised Schools.

The R.I.B.A. Silver Medal for the best set of drawings submitted at the annual exhibition of designs of students of Recognised Schools exempted from the Final Examination has been awarded to Miss Thelma Silcock (Diploma in Architecture, School of Architecture, University of Liverpool).

Examinations.

The following are the dates for the forthcoming R.I.B.A. examinations:—

Intermediate Examination.—November 20, 21, 23, 24 and 26, 1925. (Last day for receiving applications October 17, 1925.)

May 28, 29, 31; June 1 and 3, 1926. (Last day for receiving applications, April 23, 1926.)

Final and Special Examinations.—December 2, 3, 4, 5, 7, 8, and 10, 1925. (Last day for receiving applications, October 30, 1925.)

July 7, 8, 9, 10, 12, 13 and 15, 1926. (Last day for receiving applications, June 4, 1926.)

Examination for the R.I.B.A. Diploma in Town Planning.—June 30; July 1, 2 and 5, 1926. (Last day for receiving applications, March 1, 1926.)

The Smoke Abatement League.

Arrangements have been made by the Smoke Abatement League of Great Britain to hold a conference at the Palace Hotel, Buxton, from Friday, October 2, until Monday, October 5. The chief subject of discussion will be a proposal to establish in each large municipality a "smoke abatement" department in the charge of a qualified engineer, whose duty it would be to advise all who seek help in the choice of a means of lighting or heating. The public is invited to attend.

BERDEEN WAR MEMORIAL

The Aberdeen War Memorial, opened this week by the King, is in the form of a Hall of Remembrance. It is built of light grey granite, roofed by a dome covered with copper, and stands at the corner of two streets in the centre of a group of buildings forming the Art Gallery, having the original Art Gallery on one side and the new Cowdray Hall and Museum on the other. The exterior of the Hall of Remembrance is a crescent of six Corinthian columns upon a stylobate, and in front upon a terrace of steps is a lion guardian in granite modelled by Mr. W. McMillan, A.R.A. The architects for the group of buildings are Messrs. A. Marshall Mackenzie, LL.D., R.S.A., F.R.I.B.A., and A. G. R. Mackenzie, F.R.I.B.A.

The interior of the Hall of Remembrance is approached by a vestibule having marble floor and a flight of marble steps. The court is octagonal on plan with a large circular dome supported by four great arches. The floor and dado and the architraves are of dove and white marble. A circular balcony or gallery surrounds the court giving access to the various picture galleries on the first floor. A casket of gilt bronze containing the book of the Roll of Honour stands upon a white marble table in a shrine or niche in the north wall. The Cowdray Hall, which prolongs the building to the left, is built of pink and grey granite, like the original Art Gallery. The platform is arranged to accommodate a small choir and orchestra or a numerous party conducting a public meeting, and behind it is the large organ, by Binns, of Leeds, gifted by Viscountess Cowdray. The hall accommodates 700 people. The woodwork is of African mahogany, stained to a soft grey colour; and the walls are lined with the grey canvas used elsewhere in the picture galleries. The acoustic properties have had special attention, Mr. Hope Bagenal, A.R.I.B.A., acting as consultant on this matter, the problem being to adjust the design for the joint use of the hall for lectures and music.

The new buildings also include an addition to the Macdonald Collection—where are displayed the portraits of artists by themselves, which makes that collection unique in this country—and two new galleries for pictures. The upper gallery is lighted so that the light falls on the pictures and the spectators remain in comparative darkness, and reflections on the pictures are reduced to a minimum.

The principal contractors were: Mason, Geo. Hall's Trustees, Aberdeen; carpenter, R. & F. Reid, Aberdeen; plasterers, Roger & Baxter, Aberdeen; plumber, A. McRobb, Aberdeen; slater, Geo. Farquhar, Aberdeen; painter, J. S. Maclaren, Aberdeen; marble work, John Youden & Co., Glasgow; electric lighting, J. C. Laing, Aberdeen; heating, Claud Hamilton, Aberdeen. The lion was cut in granite by Mr. Arthur Taylor, Aberdeen, from the model by Mr. W. McMillan, A.R.A., Chelsea.

Forthcoming Books.

Messrs. B. T. Batsford's list of autumn announcements includes the following: Professor Richardson, F.S.A., is collaborating with H. Donaldson Eberlein in producing a work on "The English Inn, Past and Present," illustrated by photographs, old drawings and sketches; and also "The Smaller English House from the Restoration to the Victorian Era, 1660-1840," illustrated by photographs and drawings. "Living Sculpture," a series of photographic figure-studies by Bertram Park, with a historical introduction by G. Montague Ellwood. "A History of Wall-paper Design in England from the Earliest Times to 1914," prepared for the Wall-paper Manufacturers' Association by J. L. Edmondson and A. V. Sugden. "Sketching in Lead Pencil," for artists, architects, and others, by Jasper Salwey, illustrated by the author and a number of well-known draughtsmen. "The Roman Alphabet and Its Derivatives," by Allen W. Seaby, Professor of Fine Arts, Reading University.

ARCHITECTS' & BUILDERS' INQUIRY BUREAU

We are glad to give questions and answers, but cannot accept responsibility for contributed replies, especially on legal matters.

May we appeal to our correspondents to submit their queries on paper of a size easily filed, and written as legibly as possible, or, better still, in typewriting!—ED.

Water in Basement.

REPLY TO "A BUILDER'S ASSISTANT," SEPTEMBER 8.]

SIR,—The fault in the construction of the basement floor, as described by your correspondent, appears to be that though he has probably made a thoroughly waterproof skin to the floor, there is no strength in it to resist the upward pressure of water, which is considerable at basement depth. If possible, it would be best to wait for a dry spell of weather, make good the waterproofed surface, and lay thereon a 4 in. bed of concrete as a loading coat. The walls do not appear to be mentioned, but it is hardly likely that water does not penetrate these also, in which case they should be similarly waterproofed, and an outside skin of 4½ in. brickwork built against them. The most satisfactory method of all is for the waterproofing of walls and floor to be executed in asphalt, laid in two layers and similarly loaded with a bed of concrete and supported, as to the walls, with a skin of brickwork. The basement then becomes a tank from which all water is definitely excluded. Another wise provision is for a pit in the floor, from which any water that may collect can be baled out, but care must be taken that the pit also is adequately waterproofed.

"CONSTRUCTION."

SIR,—To make an absolutely water-tight job of an underground cellar, asphalt it to the damp-course level or 6 in. above ground level, and make a tank of the whole basement. The first thing is to get the place quite dry by means of sump holes dug at intervals all round the outside of the job deep enough to be below the inside floor level. The water that accumulates should be taken away frequently, and after three or four days the cellar should be dry. Then asphalt the walls and work from the outside to the centre of the room, making sure that the fillets at angles are properly made. The bottom must be immediately concreted with at least 6 in. of concrete to prevent the asphalt blowing up. As soon as the concrete is set firm enough to walk on, build a 4½ in. wall right round up to the height of the asphalt. Then fill in the sump holes, but not before.

W. TOLLEY.

A possible way to treat the walls and floor is with ¾ in. thick asphalt in two layers. In the case of the floor, lay asphalt on concrete and then cover with 6 in. of Portland cement concrete. In the case of the walls, render the asphalt 6 in. above the ground level, well tucked into the joints of the brickwork, and then either build 4½ in. thick brickwork in front of asphalt, or put up shuttering and put in 6 in. of Portland cement concrete, continuous with the floor concrete; you will then have formed a tank, so to speak. I have applied this method to many bank vaults and it has not failed to keep away the water. One might also have a sump hole at some distance to attract water from the building.

G. W. H.

Architect's Fee for Abandoned Work.

[REPLY TO B. WARE, SEPTEMBER 11.]

SIR,—Your correspondent's letter under the above head opens up a very wide and serious subject. It is very easy to point out the unwisdom (a) of not joining a professional society, and (b) undertaking work at less than the generally accepted rate of remuneration; but most of us know too bitterly how difficult it is, particularly in the case of a young man starting in practice, to avoid the offence at all times.

Having made a bad bargain, perhaps as the only means of getting something built, the architect must make the best of it, and the only point in doubt seems to be the time at which the agreed fee becomes due. Holding the letter of appointment, in which payment on completion is stipulated, the architect is quite within his rights in interpreting this to mean "the certified date of completion," i.e., the date on which the building became ready for occupation as far as the building, apart from furnishing, is concerned, and which is the date from which the specified number of months of maintenance is dated. This latter period is not for the purpose of completing things not done, but for making good defects that may appear after completion. Building owners should realise how very unfair and unwise this bartering for lower fees than the accepted scale is. Either the appointed architect is fully competent or not. If not, then it is foolish to employ him; if he is, then he is entitled to the remuneration that has been generally recognised to be a fair return for services rendered.

"WORTHY OF HIS HIRE."

Roofing Felt.

[REPLY TO "G. W. H.," SEPTEMBER 18.]

SIR,—In reply to my original letter, I have been sent some excellent samples of roofing felts, through the medium of your office, one of which is a bituminous hair-felt, that seems very good, combining the qualities of non-conducting nature together with the long life of the bituminous treatment. For the benefit of "G. W. H." I would mention that this form of felt is about double the price of ordinary hair felt, but appears to be excellent money's worth.

"CLIMATE."

Quantities.

[REPLY TO "C. H.," SEPTEMBER 18.]

SIR,—The clause quoted by your correspondent appears to be one of those "water-tight" affairs that delight the official mind. Needless to say it is very unfair, since it is obvious that to object would mean exclusion from the opportunity of tendering. "C. H." may, however, comfort himself in that, should he be threatened with grave injustice through the operation of this clause, he might go to law with every chance of a successful issue. Such matters are treated on their merits in a court of law, where the aim is equity and justice. Generally, however, surveyors to councils are men in whose hands a contractor need not fear to place himself.

"JUDICE."

SIR,—A consideration of the clause quoted, apart from any other terms of the contract (which, of course, should be referred to), would clearly appear to constitute the surveyor sole arbitrator; and his final certificate is in the nature of an award. The surveyor must do his best to act fairly and impartially whatever his natural bias may be; for, if the contractor can prove that the surveyor has acted unfairly or partially, then the decision of the latter is not binding on the contractor. "C.H." might with advantage refer to the articles on "Arbitration in Building Disputes" in our issues of January 9 and 16, 1925, where these matters are fully dealt with.

"LEGAL."

Porcelain Enamelled Taps.

[REPLY TO "CAUTIOUS," SEPTEMBER 25.]

SIR,—Two and a half years ago I fitted porcelain enamelled taps to bath and lavatory bowl in my own house. They were brass taps stamped by the local water department, and then returned to makers to be enamelled. The taps to the bath are still satisfactory, but the hot tap to the bowl is badly chipped. Singularly, the cold tap to bowl and hot tap to bath are slightly discoloured. I fitted similar

taps to a house occupied only by a man and his wife twelve months ago, and these are quite satisfactory. I should only fit them the bath myself, unless the house were occupied by very careful people, and then not over the sink we have white metal taps, a rub with a dry cloth each day keeps them in a shining condition.

H. M. RICHARDSON.

SIR,—As a user of these taps, I can confirm the opinion of "Cautious" that they are "liable to be damaged by chipping"; is a great fault with them. Another drawback is that the taps are clumsily designed, and is almost impossible to fill a kettle; the and spigot occupy nearly the whole of space of the bow handle of the kettle.

L. J. N.

Permanent Colouring of Roughcast.

[REPLY TO R. M. P., SEPTEMBER 18.]

With reference to this question, one needs more information. Is the colouring property already erected, or is it for work to be built? If the first, one should, of course, colour cream with a washable outside paint, distemper. If the job is an entirely new one, render the walls with white cement, and white spar for the roughcast.

G. W. H.

SIR,—If the white roughcast is mixed with yellow ochre to the required tint the colour should remain permanent. If it is to be coloured afterwards, wash with limewhite tinted with ochre to the required tint and fixed either with a little Russian tallow mixed in, or with a small proportion of coal tar. The latter method is generally known, but I can answer for efficiency.

"FIXATIVE."

Preservation of Bath Stone.

[REPLY TO "VOX," SEPTEMBER 18.]

SIR,—Paint will not have a deleterious effect upon the stone, but it would be a great pity to use it. Other methods can be adopted with good effect. One is to apply with a brush solution of silicate of potassium. Another is to apply with a brush a solution of paraffin wax or paraffin oil. In either case the treatment should be adopted only when the wall is absolutely dry.

"SURFACE."

The Bath stone should be re-dressed and treated with one of the many advertised preservatives for stone, or it may be painted when it is thoroughly dry. I have a house that has been painted for 30 years, and it gives no trouble whatever.

G. W. H.

Preventing Verdigris on Copper Pipes.

[REPLY TO MR. J. B. HUTCHINS, F.S.I., SEPTEMBER 18.]

SIR,—Where copper pipes are left exposed to their appearance they should be lacquered though this is a costly treatment. I do not think the varnish would be likely to remain as a permanent protection, and if the above suggestion is beyond the means of the job the only alternatives are either to sacrifice the appearance and have the pipes japanned, or for the future housewife to reconcile herself to a periodical application of good elbow grease.

"CUPRA."

Bituminous Paint.

[REPLY TO "J. A.V.," SEPTEMBER 18.]

SIR,—I can only think that the surface has not been properly rubbed down and cleaned before applying the paint, or that the bituminous paint is of inferior quality. For fresh work an undercoating of good water-paint is a wise provision before putting on the final coat.

"PAINTS."

THE BUILDING TRADE.

TECHNICAL INSTRUCTION IN STRUCTURAL ENGINEERING

report of H.M. inspectors on technical education in structural engineering, just as it has been written by those inspectors not as advisers to the Board in respect of engineering and building education. The report is intended for the information of the public, but it is thought that it will also be of use to all those in the structural engineering industry who are concerned with the education of apprentices, as well as to training bodies, officers of local education authorities, and teachers in technical schools. Inspectors have had the advice and help of several gentlemen with special experience in the industry.

The report deals with the technical training engaged in the design, construction, and erection of steel structures, so far as concerns technical schools and colleges. Much of the more advanced instruction for this industry is given in University institutions, the details of which, in most cases not being aided by grants from the Board of Education, lies outside the scope of the report. So closely connected educationally and often industrially, structural steel work is the use of concrete in combination with steel for various types of structures, that some reference to this part of civil engineering and building is made in the same report.

Technical training in schools and colleges (the report states) may conveniently be considered under two heads:—

(a) Full-time courses, extending over a period of about three years.

(b) Part-time courses, attended generally in the evenings, extending over a period of several years and usually concurrent with the gaining of experience in the industry, mainly in the drawing office.

Full-time Courses.—Full-time courses in engineering, often called mechanical or marine, are held in many technical schools and colleges, as well as in practically all Universities and provincial University colleges. These courses provide the most complete form of instruction in mathematics, mechanics and natural science, as well as mechanical drawing, which is available. In the last year of the course there are frequently opportunities for some degree of specialisation, extending to groups of students or even to individuals. The work of civil and mechanical engineering usually includes, associated with the study of the theory of structures, some practical design of steel structures, which are worked out in the college drawing office, under the supervision of the staff, not differing widely from those of the practice, along with the detailed study of designs gathered by the instructors from actual or other sources. Although college education can never entirely supersede practical experience in the industry, perhaps in no other branch of engineering can the college-trained student be of such full and immediate service in the production. In many branches of mechanical engineering design exact and complete strength calculations are not usually possible, and design is largely a matter of experience, while in structural steel design in particular the most important stresses are calculated with reasonable accuracy, and the design of them is a direct and obvious application of graphic and analytical statics, and is definitely taught in the colleges. Moreover, concurrently with the increasing use of structural steelwork and the increased complexity of structures, there has arisen a demand for greater ability in the computation of stresses in the more difficult cases which will require a higher degree just the kind of skill which a full-time course in a technical or Uni-

versity college can cultivate—i.e., skill in applying the principles of advanced technical mechanics to practical problems. It is certain that the untrained draughtsman, without a technical education of considerable depth, cannot make a serious attempt at stress computation of an articulated steel structure of a type with which he has not previously been familiar.

The existing provision of full-time courses is probably quite sufficient to meet the demand for trained men, because almost any full-time engineering course is adaptable to the needs of structural engineers. Some instruction in structural work is also provided in three or four full-time courses for building students in London and in one or two cases in the provinces. No doubt, if further provision of full-time courses in building is made, proper regard will be had to the needs of building students in respect of structural work.

(b) *Part-time Courses.*—Such courses are generally held in the evening, and are of the various kinds outlined later. A large proportion of designers and draughtsmen have had full-time general education up to the age of at least 16 years before entering the industry. For the remainder and for most of the apprentices entering works at an earlier age, attendance at a preliminary technical course, of which the essential subjects are mathematics, drawing, science, and English, is a condition precedent to successful technical study. Such preliminary courses, known under the name of Junior Courses, are to be found in all districts where any provision of technical education is made.

A consulting engineer or other designer frequently leaves a large amount of detail to be designed by subordinates. In the case of, say, a large articulated bridge structure, much of this detailed design may be work of a high order demanding a deep technical knowledge and an appreciation of the whole design. But in other cases—e.g., in a steel frame building—it may consist of details of a standard order which can be filled in by a draughtsman without much knowledge of the theory of structures. Thus it comes about that a large number of draughtsmen are employed who have not had a considerable scientific training. Many of these attend evening classes, and some of the more ambitious of them secure in this way a good technical training and become first-class designers. A complete curriculum usually covers some five years of progressive evening study.

Senior Courses.—The first three years of evening technical training, known as a senior course, is largely unspecialised and covers three evenings per week, devoted generally to mathematics, mechanical drawing and science respectively. The nature of the work in science and mechanical drawing will vary somewhat with the predominant industry of the district, but the science will consist largely of mechanics, introducing some knowledge of the strength of materials and elementary applications of the theory of elasticity. If, as is usual, the course is a general one appropriate to all branches of engineering, it will include some work in branches of engineering such as prime movers, which is of comparatively little direct interest to the structural engineer. But neither educational considerations nor public economy point to specialisation at a very early stage between different branches of engineering. In a few cases also the course at this stage is allied to that provided for architectural and building students, and here, again, the course contains elements which are included primarily to meet the needs of those engaged in

some branch of the building industry. But whatever may be the composition of the senior course, it cannot too strongly be urged that it should give thorough grounding in the principles of mechanics with some application to problems in the strength and elasticity of materials, including the elements and theory of bending, before a serious attempt is made to teach the theory of structures.

The senior course must include the necessary mathematics, which, in addition to algebra and trigonometry, should include the elements of the calculus. The student who is in a drawing office may have acquired considerable proficiency in draughtsmanship, but even in such a case experience shows that the practical applications of geometry to be learnt in a mechanical drawing class of a senior engineering or building course are not to be despised. Structural engineering frequently demands the use of geometry as a means of calculation as an alternative to other means. It is, however, most undesirable that graphical methods should be relied upon to such an extent as to supersede other means of calculation.

Senior technical courses, unspecialised but appropriate to the needs of the structural engineer, are to be found very widely distributed. In many districts they mark the highest stage to which organised, progressive, grouped courses of instruction, suitable for the structural engineer, are to be found, though occasionally an isolated class in theory of structures or a class in design, of an advanced character, may be available. Thus the completion of a senior course, followed perhaps by some special class in structural engineering, will for some students represent the high-water mark of their technical training. For others, and particularly those who aspire to become designers, the work of the senior course will be important mainly as a preparation for more advanced and more specialised studies.

There is another course of training which may sometimes, with advantage, be followed by the steelwork draughtsman who does not push his studies to an advanced stage, or go deeply into the theory of structures with a view to becoming a designer. He may broaden his knowledge of other types of construction by taking up the study of general building construction in brick, stone, timber and concrete, as well as in steel. He thereby increases his potential usefulness, for in many instances firms deal, not only with constructional steelwork, but with other portions of the construction of steel-framed buildings. He may not always find a standard course drafted to suit his individual needs and previous preparation, but there will usually be little difficulty in selecting, with the advice of the technical staff, a suitable combination of classes.

Advanced Courses.—In the larger technical colleges or schools there is often to be found more advanced evening instruction in structural engineering, for which the senior course forms a preparation, either as an organised advanced grouped course, or otherwise. It is not possible to lay down the best form which this instruction should take, for the form varies, and must vary, somewhat from place to place according to local and individual needs and the relations to other courses. But at this stage it is possible to give advanced instruction in the theory of structures, and individually, or occasionally by class instruction, to work out designs in a practical manner, and afford the draughtsman or designer opportunities which may rarely or never come within his reach in the course of his daily work in the drawing office. The educational opportunities open to the industrious student to pursue his own subject with some aid from his teachers are in some cases almost unlimited, and reach, at least, as high a standard

in structural design as can be reached by a full-time student.

But there is a demand for instruction in advanced courses of a more modest order, both for general structural steelwork, such as cranes, roofs, girders, and so forth, and for reinforced concrete work. There is also a demand for a more restricted instruction in certain branches of structural steelwork, notably in the application to steel-frame building. While structural engineering in the accepted sense of the term extends to work which lies outside the ordinary province of the builder, the increasing use of steel construction and of reinforced concrete in modern buildings renders it desirable that the builder should be acquainted with the principles upon which the design of such work is based, and particularly with the standard forms of steel and concrete construction and with the practical methods which are employed in the erection of the structure. This gives rise to a demand for some classes in structural engineering with a restricted aim, primarily for building students, who do not require to go, for example, into the question of the maximum stresses arising from a moving load in the way that is necessary for the bridge designer. The work of such classes is intended to provide students with a broad knowledge of the principles and practice of steel and concrete building construction. In some few centres, notably in institutions with a large concentration of building work, or in a monotechic institution for instruction in building, it has been found practicable to provide separate classes of such a type for building students. Frequently, however, the number of students is too small to permit of special treatment of this kind. In such cases it is most desirable that, even though the building students may have to attend the classes intended for general structural engineers and taught by engineers, they should receive some individual attention and be given examples suitable to their peculiar needs in the designs worked out in the school drawing office. This attention to the needs of building students attending general structural engineering courses has perhaps not always been given as fully as it might have been. There is a strong case for co-operation of all the teachers concerned.

Teaching.

The subject of structural engineering is taught as a part of a course or as a separate subject, sometimes by full-time members of the school staff and sometimes by visiting teachers, who are engaged in the industry. It is not possible to generalise as to the quality of the teaching, but it is often good. Perhaps the most common instances of unsatisfactory teaching are to be found among visiting teachers whose own theoretical training has not been good. Although practical designing experience in a teacher is most desirable, it should never be forgotten that the most important function of the teaching is to give the theory which cannot generally be learnt as part of the work of a firm's drawing office. It is, therefore, most desirable that the teacher should be able to appreciate exactly what ancillary knowledge his students have acquired or are acquiring, and to co-ordinate his own work with that of others. Too frequently the professional draughtsman or designer teaching an evening class as a specialist fails in this respect, and sometimes technical schools fail to provide the specialist with properly prepared pupils. The temptation is strong prematurely to hand students over to the specialist.

Valuable instruction can be provided for the craftsman, or apprentice who will become a craftsman. Courses for crafts within an industry are sometimes known as "minor" courses. The fitters, machinists and smiths do not require different instruction from that provided for the same crafts within other branches of the engineering industry. Reference may be made, in regard to the needs and provision of technical education for these craftsmen, to a report of H.M. Inspectors on trade or workshop courses in mechanical en-

gineering, which, it is understood, will shortly be issued.

There is a valuable opportunity for the provision of minor courses to serve the needs of platers and template makers. Their primary educational need is a thorough understanding of a working drawing. This can be obtained by actual practice in making mechanical drawings, which, at a comparatively early stage, can take the form of structural steel details, many of which lend themselves well to easy exercises in projection. No very great progress has yet been made in the successful provision of minor courses for platers, though some attempts have been made. Tradition counts for much in these matters, and something can be done by employers and foremen to encourage their apprentices to attend courses. Schools, too, can, with great advantage, co-operate with the works in organising courses with the advice of the managers, which would be both valuable and reasonably attractive to works apprentices. The essential subjects in such a course are undoubtedly mechanical drawing and calculations, each illustrated freely with examples drawn from structural steelwork. Steelwork erectors are craftsmen who do not usually serve an apprenticeship to the industry. They are recruited as adults and frequently from men with a seafaring experience. Technical education has not normally any object to serve for such men.

The Report is published, price 2d. net, by H.M. Stationery Office.

THE INTERNATIONAL CONGRESS OF BUILDING AND PUBLIC WORKS

As already recorded in *The Builder*, Mr. Roland B. Chessum, of London, was recently elected President of the International Federation of Building and Public Works on the nomination of the National Federation of Building Trades Employers. The Fourth Congress of the International was held in Paris in June last, when Mr. Chessum received a cordial welcome from the delegates representing forty-two countries. On Tuesday, September 15, Mr. Chessum and Mr. R. F. Van Ophem, of Paris, Director of the International, were present at a meeting of the Administrative Committee of the National Federation held at 48, Bedford-square, to enable the latter gentleman officially to remit to Mr. Chessum the office of president. The president of the National Federation, Mr. Jno. Croad, welcomed and introduced Mr. Van Ophem to the Committee.

Mr. Van Ophem, in the course of his remarks, said that it was just twenty years ago in Liège that the first International Congress of Building and Public Works met, which gave birth to the International Federation he had the honour to represent, and in the name of which he had come officially to invest Mr. R. B. Chessum (who was designated by the National Federation) as its President. It was with the greatest satisfaction that the authorised representatives of the National Federations learned during a council held on June 14 last, that the British Federation was taking a hand in the International Presidency, and it was with equal pleasure that they unanimously elected the National Federation's candidate, whose high courtesy they had had the pleasure of appreciating in many instances, as well as his intimate knowledge of international subjects. The late lamented president, Mr. Despagnat, was really very pleased, as were all his colleagues—and he (Mr. Van Ophem) in particular—to see the National take the lead in the International, the authority of which was so vividly illustrated during the recent Paris Congress, when forty-two nations were represented by seven hundred delegates. In handing over the presidency to Mr. Chessum, Mr. Van Ophem appealed for the National Federation's close co-operation and support, and felt convinced of obtaining both. In conclusion he said the British colleagues had before them a noble effort to continue and

a noble work to perform, and that the International Federation and its permanent office believed that, with the support of the National Federation and under the British chairmanship, many vital problems for the International would be solved. He expressed the gratitude of the International for what the National Federation had done already and for what he was sure they would do in the future.

The National President (Mr. Croad) could assure Mr. Van Ophem that it was with very great pleasure that the members of the Administrative Committee had heard his speech, and he had to compliment him on the power with which he had been able to express himself in the English language, on behalf of the Committee he sincerely thanked him for his address.

Mr. Chessum, the President of the International, said the members, having heard Mr. Van Ophem address them in their own language, could not, he thought fail to appreciate some of his own feelings when he had been addressing not only his French compatriots, but also a mixed assembly of a Congress where forty-two countries were represented. He was glad to have the opportunity of replying and formally accepting the presidency at Mr. Van Ophem's hands, chiefly because he was deeply sensible of the great honour that had been conferred upon him by being the first Englishman who had ever held that position. As he became more familiar with the details which surrounded this important office, the more he was deeply convinced of the obligations that were cast, not only upon the individual, but on the groups of individuals who were responsible for the maintenance of the existence of the Federation Internationale. Those who attended the recent Congress in Paris must have been struck by the warmth of their reception, the cordiality and the *bon camaraderie* that existed among the delegates who so attended. The subjects were discussed with great enthusiasm, and preparation of the reports for those subjects had entailed on the different countries represented a vast amount of time, consideration and expense. He was the more sensible of the responsibilities of this position and of the need of the enthusiastic support of the National Federation of Building Trades Employers: the outlook that is given from the Bureau of the International Federation. Correspondence has already commenced to flow in from various countries that had attended those meetings.

He would like to refer to a proposition which was made on behalf of the Americans in connection with an international competition, a view to promoting and facilitating the construction of houses for the middle and intellectual classes. The suggested form of competition was that a sum of one thousand dollars should be awarded in prizes of hundred, three hundred, and two hundred dollars. In due time the Bureau would be the actual forms to the National Federation of Building Trades Employers for their consideration, and it was hoped their active support would be forthcoming. There would also be sent in due course a list of the members posing the new Bureau as constituted when the Congress took place in Paris.

He had been able to secure from Mr. Van Ophem some details with regard to the finances of the International, and found that the revenue was much below what it ought to be, and that the expense of running the International had largely fallen upon the shoulders of the gentleman who was there that day to whom they were giving a welcome. It was a position which was intolerable, an burden ought to be borne by the respective countries, and so win the support which would enable the duties of the International Federation Administration to be conducted in a way as to be worthy of its great office.

With the decease of their late president, M. Despagnat, there had been lost to the International Federation a man held in the very highest regard, a man of whose ability everyone was well aware, and he (Mr. Chessum) was conscious, in following the

of such a past master in conducting the affairs of the International Federation, of the gravity of the responsibility he had undertaken. If at the end of his term of office he was able to feel that through his appointment as an individual and a representative of his great country, supported by the National Federation membership, had been able to improve in some small degree the international relations, then he would consider that he had contributed something to a work which was one of the highest ideals that any man could hope to aspire to. It was in that sense that he had gladly taken on the position, and with the deep conviction that he would be heartily supported by the National Federation of Building Trades Employers who had permitted him to accept the position. He appealed to the individual members to take interest in the affairs of this great International Federation, read its propaganda which reached their headquarters, and consider the results of its deliberations.

Continuing, Mr. Chessum said he would like that meeting publicly to tender to Mr. Van Ophem his keen appreciation of his consistent friendship since the first time when he (the speaker) had represented the National Federation at any of the meetings of the Federation Internationale. He would reserve further comments until another occasion, which he hoped they would grant him, in order that he might be able to preach the gospel that he held, and which he was deeply convinced was right, to members of the National Federation throughout the country, in order that they might go back to their Regions and invoke more interest in the Internationale.

Mr. Ernest J. Brown said he desired to take the opportunity, as the oldest past-president of the National Federation present, to say how pleased they were as an Administrative Committee, and how pleased were the members of the London Region present, at the election of Mr. Chessum to the office of International President, and how grateful they were to their friend Mr. Van Ophem for coming here to perform that act of courtesy. On behalf of those who had been responsible for the appointment of Mr. Chessum, he thought they should offer Mr. Van Ophem their best thanks for making this journey to London and for the many kind courtesies he had shown to those who had had the privilege of meeting him and his colleagues in Paris.

This, on being put to the vote, was carried with enthusiasm.

On Tuesday evening, September 15, Mr. W. Croad, the president of the National Federation, entertained the president and secretary of the International Federation (Mr. J. B. Chessum and Mr. R. F. Van Ophem) to dinner at the Hotel Victoria, Mr. A. G. White (National general secretary) also being present. After dinner a long conversation took place on the aims, ambitions, income and policy of the International.

THE TRADE UNION CONGRESS

For late years the reports of the proceedings of Trades Union Congresses have been read with a sense of disappointment, for whilst the nation is earnestly desirous to see peace established both in industrial affairs at home and in international relations, the general tenor of the speeches delivered at Congress have been belligerent as regards industrial matters. Some of the resolutions, instead of being directed to an improvement in industrial relations and conditions under the existing order of affairs, have been concerned with a revolution of the whole system.

Since 1913 the trade unions have been political as well as industrial organisations, and the introduction of the political element into account for the tone of the speeches, for we have never heard of peace in politics. Political feeling is always expressed in belligerent terms; between all parties it runs high at every election, and on such occasions the ex-

tremists, from the strength of their political fervour, take the leading part, but the opinion of the majority, though not voiced, is generally found to support the happy mean between extremes. Of course, it may be regretted that trade unions should no longer be what they were, purely industrial organisations concerned with industrial conditions, but it was the natural outcome of remedial industrial legislation that a political element should be introduced into industrial matters and that a water-tight bulkhead could no longer be maintained between the industrial and the political aspect of such questions. Unfortunately, at Congress the political side takes pre-eminence, and thus the proceedings almost pass out of the sphere of such journals as ours, which take no attitude in politics, but only regard the industrial aspect of questions.

One of the first resolutions moved at this Congress related to a consolidation of forces for militant purposes, having for its object the conferring upon the General Council the power to call a general strike. This resolution stood over for further consideration. Another resolution was directed to limiting the number of unions with a view to amalgamation. This resolution might have something to be said for it from an economic point of view, for, as Mr. Naylor, M.P., who moved an amendment, pointed out in his speech, conflict between unions engaged in mutual operations is the cause of cost to employers and ratepayers, but the avowed object of the resolution was to facilitate combined action in the event of disputes arising. This resolution, as well as Mr. Naylor's amendment deprecating the merging of all unions in one big union, was not carried. But a resolution moved by Mr. Joseph was carried on a card vote by 2,456,000 votes to 1,218,000. This resolution was as follows: "That this Congress declares that the Trade Union movement must organise to prepare the unions in conjunction with the party of the

workers to struggle for the overthrow of capitalism; at the same time Congress warns the workers against all attempts to introduce capitalist schemes of co-partnership, which in the past have failed to give the workers any positive rights, but instead have usually served as fetters retarding the forward movement; Congress further considers that strong, well-organised shop committees are indispensable weapons in the struggle to force capitalists to relinquish their grip on industry, and therefore pledges itself to develop and strengthen workshop organisation." This resolution expresses the objection to co-partnership which was openly avowed in the "Lever Case," that community of interest with the employers saps the influence of the unions, and it also forges a "weapon" to be used for the coercion of members of the unions.

Speaking on the first of the above resolutions, Mr. A. J. Cook is reported as saying: "The power of Labour was a great power. The Trades Union Congress was the parliament of the future." Mr. J. H. Thomas's observation, made in a speech to railwaymen at Scarborough before the opening of Congress, seems apt in connection with such utterances, for he reminded his hearers that, however strong and powerful any section of the workers might be, it was not stronger nor more powerful than the community as a whole. Speaking on this resolution at Congress, Mr. Thomas pointed out that if the resolution was passed it would put the General Council in the unfortunate position of having to determine what was or was not a vital principle. But it would put the community in a more unfortunate position, for a trivial occurrence may occasion the raising of what the unions may deem to be a vital principle. Recently a dispute arose out of the unauthorised action of an official in excluding a pet dog from an omnibus. The handling of that official by his employers might well give rise to circumstances which the

NEW BUILDINGS IN LONDON.

unions might consider raised a vital principle, and such a dispute might contain seed which would fructify into a general strike.

Mr. P. Leigh moved a resolution calling for the consolidation of all existing laws relating to the safety of those concerned in road traffic, which also contained suggestions as to the condition on which driving licences should be granted, and this was carried unanimously.

Unemployment was only touched upon slightly; a resolution, moved by Miss Wilkinson, that Congress should accept the National Unemployed Workers' Committee as an affiliated body, was ruled out of order; but a resolution moved by Mr. Hayday, M.P., calling upon the Government immediately to introduce an amending Act to provide for the payment of continuous benefit to the unemployed without reference to extended or standard benefit, and calling on the General Council to consult with the Labour Party with a view to introducing a Bill to enable the Ministry of Labour to appoint trade unions as agents to administer wholly and solely the Unemployment Insurance Acts on behalf of their members, if they so desired, with adequate and proper remuneration for this administrative work, was, however, agreed to.

The first part of this resolution appears to lose sight of the fact that Unemployment Insurance is a system of insurance which originally was founded upon an actuarial basis. Circumstances have compelled the system to be relaxed to meet what was hoped would be temporary distress; but a stage may be reached when the idea of "insurance" will drop out altogether and benefit be administered under another title. It is of vital importance that the scheme of insurance against unemployment should stand on a sound financial basis when normal conditions again prevail, and it may be a question whether it is not to the interest of those who are receiving benefit to which they are contributing that the scheme should be kept intact, and exceptional benefit be paid as assistance under another name and from a special fund.

A long resolution was moved by Mr. Fawcett in relation to the houses erected under Lord Weir's scheme, which was to the effect that all working-class representatives on all public bodies interested in housing schemes should be called upon to do their utmost to frustrate the adoption of the Weir house scheme until Lord Weir's firm agrees to observe the same rates and conditions as every other employer in the building industry, and this was carried unanimously. During the discussion one speaker appears to have expressed his dislike of that form of building, but from the resolution itself and the general terms of the speeches, it appears that the houses were not in themselves objected to, but the sole question was the wages rates paid to those employed in their construction.

A resolution that "this Congress instructs the General Council to urge upon His Majesty's Government the desirability of giving to national agreements voluntarily entered into and approved by joint industrial councils the same validity as awards under the Trade Board Acts, 1909 and 1918, with the object of ensuring the observance of fair conditions of labour by all engaged in the industry whenever requested by parties to the agreement" was carried by a large majority. We notice that in the debate some objection was taken to the resolution on the grounds that it might open the door to compulsory arbitration and that it might deprive the unions of the immunity from legal proceedings conferred by the Trades Disputes Act.

The Trades Union Congress, within the limits of a short week, has to consider such a vast number of subjects raised by resolutions set down by any of the affiliated unions without selection, that its proceedings should not be judged by the same standards which would apply were the subjects for debate selected by the Central Body alone and Congress made the occasion for consultative deliberation on urgent industrial questions.

Bermondsey.—The "George" public house, in Flockton-street, S.E., is to be pulled down and rebuilt in connection with the L.C.C. Hickman's Folly slum clearing scheme. Plans have been prepared by the brewery's surveyor.

Camberwell-grove.—The L.C.C. have agreed to give financial support to the extension scheme of the Mary Batchelor School for Girls at Camberwell-grove, S.E. Mr. W. Curtis Green, A.R.A., architect, 5, Pickering-place, S.W.1. The cost will be approximately £40,000.

Chelsea.—New buildings are being erected at St. Mark's College in King's-road, Chelsea, for students and staff. Messrs. Rice & Son, contractors, 15, Stockwell-road, S.W.9. Messrs. Beazley & Burrows, architects, 17, Victoria-street, S.W.1.

Chertsey.—A new printing hall, &c., for Messrs. Rawlings & Walsh, Ltd., will shortly be erected at Windsor-street, Chertsey. Mr. W. J. Parker, architect, High-road, Byfleet. Messrs. W. G. Tarrant & Co., Ltd., contractors, Chertsey-road. Constructional steelwork by Messrs. Young & Co., 6, Queen Anne's-gate, S.W.1.

Croydon.—A local syndicate has promoted a scheme for the erection of 22 blocks of flats. Mr. Frank Windsor, architect, 1, Station-approach, Croydon.

East Ham.—Messrs. Davies & Emanuel & Henry C. Smart, 73a, Queen Victoria-street, E.C.4, have prepared plans for new shop and showrooms in Green-street, for Messrs. Rego Clothiers, Ltd., outfitters.

Eltham.—A new public house is to be erected in Eltham High-street, S.E. Mr. Nowell Parr, architect, 42, Cranley-gardens, South Kensington, S.W.7, on behalf of Messrs. Style & Winch, Ltd., Battersea.

Fleet-street.—Messrs. Mabey & Johnson, 4, Cullum-street, E.C.3, are pulling down old buildings on the site of 56, Fleet-street, E.C.4, preparatory to the erection of large premises for occupation by the *Glasgow Herald* and *Glasgow Evening News*. The architects are Messrs. Percy Tubbs, Son & Duncan, 30, John-street, Bedford-row, W.C.1.

Gower-street.—A large block of property in Gower-street, W.1, is to be pulled down and new showrooms and workshops erected for Messrs. Maple & Co., Ltd., Tottenham Court-road, W.1. Plans by Mr. J. McPherson, the company's architect.

Gray's Inn-road.—The governors of the Royal Free Hospital in Gray's Inn-road, W.C., have decided to erect new children's ward and other buildings at a cost of about £50,000, to plans prepared by Messrs. H. V. Ashley & Winton Newman, F.R.I.B.A., 14, Gray's Inn-square, W.C.

Great Smith-street.—New premises are to be erected on the site of Nos. 35-38, Great Smith-street, to provide additional accommodation for the National Library for the Blind in Tufton-street, S.W.1. Mr. Sydney Tatchell, F.R.I.B.A., architect, Bank Chambers, 32, Strand, W.C.2. Messrs. Higgs & Hill, Ltd., builders, Crown Works, South Lambeth-road, S.W.

Horseferry-road.—The Trustees of the Peabody Donation Fund are to build a block of tenement dwellings on a site in Horseferry-road, S.W.1, bounded by Great Peter-street and Chadwick-street. Mr. Victor Wilkins, F.R.I.B.A., architect, 12, York Buildings, Adelphi, W.C.2.

Kennington Oval.—Designs are to be prepared for the erection of large buildings in connection with the removal of the Archbishop Tenison's Grammar School from its present site at St. Martin's-in-the-Fields.

Kingston.—A sum of about £13,000 is to be allocated for the building of an assembly hall and additional classrooms at the Kingston Grammar School. Messrs. Jarvis & Richards, architects, 60, Tufton-street, S.W.1.

Lambeth.—The estimated cost of rebuilding and extending the Borough Polytechnic Institute in Borough-road, S.E.1, is estimated at

£79,804, exclusive of the purchase of site additional buildings. Mr. W. Courteney Maitre, F.R.I.B.A., architect, 133, Moorfields, E.C.

Lewisham.—A nurses' home, &c., is to be erected at the Infirmary for the Lewis Board of Guardians. Messrs. J. Doug Mathews, Son & Ridley, architects, 3, P. Bakehouse-court, Godliman-street, E. Messrs. Leslie & Co., Ltd., builders, Kensal square, W.8, whose tender amounts to £15,000.

Little Trinity-lane.—A new warehouse is to be built for the Hudson Bay Co., the contractor being Messrs. Trollope & Colls, Ltd., 5, Coleman-street, E.C.2. Messrs. Williams & Cox, architects, 27, Henrietta-street, Covent-garden, W.

Limhouse.—Extensions to Messrs. Taylor & Co.'s premises in Church-lane, Limhouse, E., are being carried out by Messrs. William Shurmer & Sons, Ltd., Riverside Works, Upper Clapton, E. Steelwork by Messrs. Young & Co., 6, Queen Anne's-gate, S.W. Messrs. William Bradford & Sons, of Cannon Chambers, Regent-street, S.W.1, are the architects.

Long Acre.—New printing works and warehouse are to be built at Nos. 87-91, Long Acre, W.C., for Odhams Press, Ltd. Messrs. Francis Chambers & Son, architects, 119, College-lane, E.C.4.

Loughborough Junction.—The Salvation Army propose to build a new mission hall on a site in Wanless-road, S.E., to accommodate some 400 persons. Mr. Oswald Archer, architect, 101, Queen Victoria-street, E.C.4.

Ludgate Hill.—Additional showrooms are to be built at No. 60, Ludgate Hill, E.C.4, for Messrs. W. Abbott & Sons, Ltd., boot and shoe manufacturers.

Merton.—The Cannon Hill estate at Ray Park, S.W., consisting of over 250 acres, is to be developed on "garden city" lines, having been purchased by Mr. George Blay, of New Malden. About 2,000 houses, the first of which have been designed by Mr. F. H. Hooper, 67, North-side, Clapham Common, S.W., and Mr. H. G. Turner, Perrymount-road, Haywards Heath, are to be erected.

Muswell Hill.—The governors of the Horns Finchley and Wood Green Isolation Hospital in Coppett's-road, N.W.10, propose to expend about £24,000 upon extensions. Mr. E. Lovegrove, architect, Southwood-lane, N. 6.

New Oxford-street.—The Westminster Bank Ltd., are to build new bank premises in New Oxford-street, W.1. Messrs. J. Campbell Jones, Son & Smithers, architects, 9, Dowgate-hill, Cannon-street, E.C.4. Messrs. L. H. & Roberts, builders, 144, Lower Clapton-road, E.

Newington Causeway.—It is proposed to build an outpatients' department in Newington Causeway, S.E., for the South London Hospital for Women. Mr. Marcus E. Collins, F.R.I.B.A., architect, 115, Old Broad-street, E.C.2.

Piccadilly.—Shops and flats are shortly to be erected upon a site in Piccadilly, W. Messrs. Trehearne & Norman, architects, Windsor House, Kingsway, W.C. Messrs. Griggs & Co., builders, 100, Victoria-street, S.W.1.

Regent-street.—The corner shop and office premises in Regent-street and Glasshouse-street, W.1, are to be rebuilt under the supervision of H.M. Office of Woods and Forests to the plans of Messrs. North, Robin & Wildes, 35-39, Maddox-street, W.1.

South Kensington.—Sketch plans are under consideration for new buildings for the Museum of Practical Geology. The work will be supervised by H.M. Office of Works, Storey's-gate, S.W.1.

Shoreditch.—"The Britannia" public house at Maidstone-street, E., is to be rebuilt. The owners are Messrs. West's Brewery Co., Ltd. Hackney-road, E.2. Mr. S. F. S. Y. F.R.I.B.A., architect, Bank Chambers, John-street, E.C.1.

Warwick-street.—New shop and office premises are to be erected on the site of Nos. 23, 24, Warwick-street, W.1. Mr. F. Cul Nichols, architect, 37, Norfolk-street, Strand, W.C.2. Messrs. George Parker & Sons, Ltd., builders, 124, Summer-road, Peckham, S.E.

(For rates of wages in the Building Trade in Scotland, see page #13.

West Ham.—Alterations and improvements are to be made to shop premises at Nos. 36-38, Woodgrange-road, E., owned by Messrs. L. W. Pratt & Sons, drapers. Mr. R. C. Turner Gordon, architect, 304, Romford-road, West am.

Westminster.—Westminster C.C.'s new baths Marshall-street, S.W. 1, will shortly be started. Plans under the direction of Mr. Veit, City Surveyor, to whom Mr. A. R. Conder, R.I.B.A., 42, Cecile Park, W. 8, has been appointed architectural assistant.

Willesden.—A new factory and warehouse to be erected in Edgware-road, N.W. 10, to plans by Mr. A. H. C. Arnell, 59, Bridge-lane, Ealing Green, N.W.

Wilton-road.—Large market and shop premises are to be erected in Wilton-road, S.W. 1, on the site of old property at Nos. 104-105. Mr. S. Gordon Jeeves, architect, 16, Hanover-square, W. 1.

TRADE NEWS.

Bell's United Asbestos Co., Ltd.

The directors of this company have declared an interim dividend on the ordinary shares of 1s. per share, being 2½ per cent. (actual) less income tax, on account of the current year. The dividend will be paid on October 19 to shareholders on the register on October 5, and the ordinary share transfer books will be closed from October 5 to 17, both dates inclusive.

The "Apex" Hollow Concrete Block.

A new hollow concrete block, known as the "Apex," patented by Mr. L. A. Pitcher, of Leicester, and made on the Springfield block machine manufactured by Messrs. Goodwin, Kirby & Co., Ltd., of St. Margaret's Ironworks, Leicester, is claimed to have many special advantages, including the following:—(1) The cost of production is low owing to the small amount of material required in comparison with the area covered; (2) there is a complete and continuous air circulation ensuring dryness and facilitating maturation of the block; (3) there is ample strength owing to the bridges connecting the inner and outer wall surfaces being part of one block; (4) the block is easy to handle. It may be added that the block is made face upwards, thus enabling a much more impervious face to be formed than would otherwise be possible. Considerable saving in mortar is also effected. A variety of different face patterns may be offered. The machines are light and easily portable, so that they can be taken on to building site and the blocks made on the job if necessary.

Coulsdon Court Estate.

Messrs. Trehearne & Norman, architects, wish to point out with regard to our paragraph under this heading last week that they are only acting as architects for the approval of the plans of any houses to be erected, and not architects for the Estate.

The Building Surveyors' Association.

The next quarterly general meeting of this Association is to be held in the Council Chambers, Town Hall, Leeds, on Saturday, October 10. The following is a suggested programme, the giving out of the first part of which depends on the number of members able to attend in the morning. 10.20: Meet by General Post Office, Leeds. 10.30: Move off to visit modern building works of Messrs. Montague Burton. 11.0: Lunch at Gambit Café, Park-row. 11.15: Visit Art Gallery and Municipal Buildings. 12.15: Paper by Mr. F. E. Drury, M.Sc., F.R.S., M.I. Struct. E., Head of Building Department, College of Technology, Manchester. 1.30: General meeting. Those who propose to attend should communicate with Mr. M. Cross, Secretary, Lit. and Organising Secretary, 42, High-street, Bramley, Leeds.

CONTRACTS, COMPETITIONS, &c.

For some contracts still open, but not included in this List, see previous issues. Those with an asterisk are advertised in this number. Certain conditions beyond those given in the following information are imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in; the name and address at the end is the person from whom or place where quantities, forms of tender, &c., may be obtained.

BUILDING, PAINTING, ELECTRIC LIGHTING, HEATING, etc.

PROPOSED NEW BUILDINGS & OTHER WORKS

In these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building work taking the responsibility of commencing before plans are finally approved by the authorities, "proposed" works at the time of publication have been actually commenced. Abbreviations: T.C. for Town Council; U.D.C. for Urban District Council; R.D.C. for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; B.C. for Borough Council; P.C. for Parish Council; M.H. for Ministry of Health; M.T. for Ministry of Transport; C.B. for County Borough; B.E. for Board of Education; M.A.B. for Metropolitan Asylums Board; and M.W.B. for Metropolitan Water Board.

ABBERLEY.—Martley R.D.C. are being asked the Worcester C.C. what steps are to be taken to improve the isolation hospital.

APPLEBY.—The Housing Committee has considered the question of adopting a scheme for the erection of 12 houses, and has instructed the surveyor to submit block plans of a lay-out of the houses.

BALFACASTLE.—The Antrim C.C. has approved borrowing of £10,000 for building a combined technical and secondary school.

BALROTHERY.—The Consulting Engineer has submitted to the R.D.C. a scheme for a new water supply to Balbriggan and Skerries at an estimated cost of £27,750.

BARNES.—The U.D.C. are considering the provision of public swimming baths.

BARNSELY.—The Sites and Buildings Sub-Committee has received a letter from the B.E. stating that, subject to the approval of the proposed loan by the M.H., would sanction the erection of a new Council School, Winthorpe at an estimated cost of not more than £14,157.

BEWLEY.—Worcestershire E.C. are considering provision of increased school accommodation at Bewdley and Wribbenhall.

BIRMINGHAM.—The E.C. propose to proceed with second section of work at the new school on the Billingham estate providing additional accommodation for pupils. It is proposed to complete the East Wing, Centre Block on the Moseley Boys' Secondary School by direct labour, at an estimated cost of £13,000. Managers of St. Vincent's R.C. schools have submitted an amended plan of a proposed new school, Vauxhall-grove, with a available accommodation for children.

BLITH.—The T.C. recommended the approval of principle of the formation of a Joint Hospital for the treatment of smallpox.

BOURNEMOUTH.—The foundation-stone of Bournemouth's new pavilion, which is to cost £200,000, been laid.

BRENTFORD.—The Gas Accumulator Co., of Brentside House, have a scheme for internal reconstruction of Brentside House for the provision of accommodation. Refreshment rooms are to be provided at Boston Manor Park, at a cost of about £1,500. The Surveyor is to report on the cost of converting Mansion House into living quarters, and alternatively for a public hall. Plans have been passed for houses on a garden estate for Messrs. Douglas & Barley, Ltd.

BRIGANTON.—Funds are being raised for the erection of a church hall in connection with Clermont Congregational Church, Preston. The scheme is estimated to cost £2,350. The C.B. resolved (a) that the Borough Surveyor be instructed to report with an estimate of the cost of improving the accommodation at Western Bandstand lavatory, and (b) that the Committee are unable to recommend the Council to demolish the men's lavatory at the Western Borough Bandstand but are prepared to consider any scheme which may be submitted for improving the same.—The M.H. prepared to approve the tender of Messrs. J. L. & Son, Ltd., for the erection of 16 concrete hop-parlour type, in Hereford-street.—The Council resolved that application be made to the M.H. for sanction of borrowing of £3,000 to defray the cost of the chase of a portion of Hodshrover Meadow as a site for the Moulsecomb Junior Mixed School.—Plans pass 10 garages, 1A, Dyke-road-drive, for Mead & (Brighton), Ltd.—The T.C. propose to erect 32 flats at a cost of £18,000, at Moulsecomb.

BROMSGROVE.—Worcestershire E.C. propose to carry out a scheme for remodelling the Stourbridge school.

BUCKINGHAMSHIRE.—Under the auspices of County Council, local authorities are to combine the provision of accommodation for mentally defective children.

BURNHAM-ON-SEA.—Particulars are now available of the instructions which have been given to surveyor of the U.D.C. respecting the provision of additional shelters and conveniences. At the St. Vincent's shelter alone it is estimated £3,000 will be spent. Victoria-street, at an estimated cost of £195, a scheme approach to the town will be made, in accordance with a long deferred scheme.

BURY.—Plans have been approved for the erection of 20 houses in Mosley-street, Market-street, Woodley-street.

CARDIFF.—Funds are being raised by the parish of St. Joseph's, Cardiff, for the erection of a new school and plans are being prepared by Messrs. F. R. & Son, Capital and Counties Chambers, 30, Commercial-street, Newport.

* See also our List of Contracts, Competitions, etc.

CARLTON.—Plans were approved for the erection of eight additional houses on the Standhill-road site, an estimated cost of £4,810, for the U.D.C. The necessary sanction has been received for the erection of a second lot of 16 houses on the Conway-road site, and the Council has decided to make application for necessary loan.

CASTLEBAR.—£32,000 has been made available by the Ministry of Finance for the restoration of the literary barracks.

CHORLEY.—The T.C. has received sanction to borrow £1,925 required to purchase land between Harrison and Pilling-lane for house erection.

LITAKEORE.—Plans have been prepared for the erection of a proposed new fire station, ambulance accommodation and offices, at an estimated cost of £5,000.

CONVENTRY.—The E.C. recommend that application be made for sanction to a supplemental loan of £2,174 in respect of extensions at Barr's Hill Secondary school, and the Housing Committee recommend that application be made to the M.H. for sanction to a loan of £270,000 for the erection of additional houses and site at the Radford housing estate.

DARLINGTON.—The T.C. have decided to build 100 houses on the Eastbourne site, subject to the approval of the M.H.

MORETON.—Funds are being raised by the parishioners of the Church of the Sacred Heart for the proposed erection of new school buildings.

MULLINGAR.—The Mental Hospital Committee has decided to build houses for their staff.

NORTHAMPTON.—A proposal is afoot for a £40,000 road-reconstruction scheme.

NORTHINGHAM.—The B.G. has provisionally approved plans for extensions to the Bagthorpe institution. The scheme is to provide a separate hospital for 150 children. The hospital has been designed by Messrs. W. B. Stair & Hall.

OLDBURY.—The U.D.C. contemplate the erection of 100 houses. Worcestershire E.C. has approved plans for the erection of a headmaster's house at the Secondary School, at an estimated cost of £1,000.

OLDHAM.—The M.H. has given formal sanction to the borrowing of £16,000 for the erection of dwellings on the Hollings housing site.

PETERSFIELD.—Plans of 48 new houses proposed to be erected by Mr. T. Draper beyond Novell-road were approved by the U.D.C.

PLOMESHATE.—The R.D.C. has received notice from the East Suffolk C.C. stating that they propose to construct a bridge and retaining wall at Rendham at an estimated cost of £1,039.

PORTLAND.—The U.D.C. are to consider the formation of a housing scheme.

PRESTON.—The E.C. had decided to proceed with the erection of an elementary school on the land in Selborne-street. The Unemployment Grants Committee has approved the reconstruction of Crown-street and 11 other streets. The Borough Surveyor is authorised to obtain the tenders for the erection of 100 houses on the Delaware-street site.

RADSTOCK.—The architect is to prepare plans for the erection of 12 parlour-type houses on the West Hill site.

RAWMARSH.—The U.D.C. has recommended the Chairman and a Surveyor to interview the M.H. with regard to the building of 100 houses, and ask for sanction for the building of a further 20 houses. The M.H. has sanctioned the borrowing of £47,307 for the 100 houses.

REAR.—The Borough Surveyor has been instructed by the T.C. to prepare plans and estimates for the erection of a floral hall.

RIPON.—The appeal for subscriptions toward the estimated cost of extensions to the Ripon Cottage Hospital is being fairly well responded to. The estimated cost of the building and equipment is £5,600. The extensions to be carried out comprise: A block containing a men's ward of ten beds, a women's ward of ten beds, a children's ward of six cots, two large verandas, and a nurses' duty room.

ROCHDALE.—The Council have decided to make application to the M.H. for permission to erect a further batch of 60 to 70 houses on a part of the Tuff Hall estate. Plans have been approved for 190 of the 200 subsidy houses which have been sanctioned.

ROTHERHAM.—The E.C. has decided to extend the Badsley Moor-lane Council school to provide 250 places.

ROYTON.—Plans were submitted and approved by the E.C. for the proposed new school at Crompton House. A central school is now very much in evidence with the Committee, and plans have been prepared by the County Architect for a school with a total accommodation for 412 scholars.

SEGEFIELD.—The R.D.C. has approved plans for the erection of a masonic hall at Ferryhill, for the Rowlandson Lodge.

SHARDLOW.—The M.H. has held an inquiry concerning the water supply to an extensive portion of its area, including the parishes of Draycott, Ockbrook, Borrowash, Chellaston, Elvaston, Ambaston, Thulston, Aston, Shardlow, Breaston, &c. It was resolved to launch a scheme, subject to the approval of the M.H., to cost upwards of £41,000, by which the whole of the area concerned would be supplied from the Derwent Valley water scheme.

SHERINGHAM.—The U.D.C. has decided to build a public hall in Bridge-road, at a total cost of £7,000.

SOUTHSEA.—In connection with the Southsea Common scheme another £20,000 is to be spent this winter by the T.C.

SPILSBY.—The R.D.C. has received from the M.H. approval, conditionally, for the erection of 22 houses: Tynston St. Peters 6, Eastville (No. 2) 8, Stickford, Old Bellingbroke, West Fen, Friskney, Low Road, and Wainfleet St. Mary 2 each. The Council decided that tenders be invited.

STOKE-ON-TRENT.—The Sewage Works Committee recommend the approval of the sewage works scheme at Trent Vale. The purpose of the scheme is to deal with the Stoke and Fenton areas, and the estimated cost of the construction of the works is £117,806. The Committee also recommended that the scheme be adopted, and the M.H. be asked to sanction a loan for the work.

The Town Clerk has received sanction to borrow £329,000 for the erection of 700 houses on the Meir and Abbey sites, by the M.H. The T.C. recommended that application be made for sanction to the borrowing of £2,250 for the purchase of additional land for housing in the Northwood Park area. The Baths and Markets Committee are considering the erection of abattoirs.

STOURPORT.—The U.D.C. has acquired a housing site of 94 acres. Worcestershire Standing Joint Committee have purchased a site at Lickhill-road, for the erection of two police cottages.

SUN ERLAND.—The E.C. entered upon the preliminary stages of an expenditure involving nearly £250,000. They agreed to seek tenders for the erection of a new secondary school, the cost being £102,000, and to purchase land in Durham-road, near the Children's Hospital, as well as to enter upon the compulsory purchase of part of the old Sunderland football ground in Newcastle-road. On both the pieces of ground the Council proposed to build elementary schools.

SWANSEA.—The M.H. has agreed to the acceptance of the tender of £63,500 in respect of the Llanmallet sewerage scheme. The C.B. resolved that the Main Drainage Committee be urged to extend as soon as possible the sewer at Llangfelach-road, Treboeth, to enable the houses in the proposed ten new streets at Penlan estate, Treboeth, providing for building plots for about 600 new houses to be joined thereto instead of to cesspools or septic tanks. The C.B. are to apply to the M.H. for sanction to the loan of £75,540 to cover the cost of the work in the erection of a school.

The Home Secretary has approved plans for the Llanmallet Police Station prepared by the Borough Architect, and the C.B. has resolved that the Borough Architect be requested to obtain tenders for the erection of the Police Station. The Director of the E.C. reported that the B.E. had approved the plans submitted for the new school at Llanmallet, and the Council resolved that the Director and the Borough Architect obtain tenders for the erection of the school.

The Borough Estate Agent reported that the Earl of Jersey was prepared to sell the freehold of a piece of land at Winch Wen, Llanmallet, to the Corporation, for the purpose of the erection of a sub-station, and which the C.B. decided to purchase.

TOTTENHAM.—The U.D.C. passed plans: Thirteen houses, Elm Park-avenue; two houses as shops, St. Ann's-road; eight houses, Downhills-avenue, and for a road showing 12 houses; six houses, The Avenue; parish hall, St. Benetfink; five houses, Coniston-road; six houses, Boundary-road; United Methodist Church, The Avenue; preliminary plan of factory, Tiverton-road; four houses, Boundary-road.

TRALEE.—The U.D.C. adopted the Town Surveyor's scheme for main intercepting sewerage for the town, which would cost £29,582 19s. 10d., and a scheme for relaying the streets and surfacing in concrete at a cost of £45,911 6s. 4d.

WEETSLALE.—The R.D.C. has resolved to make application to the M.H. for permission to erect an additional 45 houses on the Seaton Burn site.

WEMBLEY.—The Surveyor has prepared a scheme for a western outfall sewer which is estimated to cost £51,841. It is suggested that the Surveyor should prepare plans for a town hall at the earliest possible moment, and meanwhile it is recommended to invite tenders for temporary office accommodation at the rear of the Council offices at a cost of about £1,000.

The Surveyor is to prepare plans for a caretaker's lodge at the cemetery and the erection of a chapel in under consideration. Plans passed: 38 houses, Bassingham-road and 12 in Danethorpe-road, for A. Holland.

WATLEY.—The U.D.C. has instructed the surveyor to prepare plans and estimates for construction of a glass shelter.

WOLVERHAMPTON.—Funds are being raised by the parishioners for a proposed new parish hall.

WOODHOUSE (SHEFFIELD).—The West Riding E.C. has decided to provide additional accommodation at the secondary school, at an estimated cost of £2,426.

WORCESTERSHIRE.—The C.E. are negotiating with school managers with regard to structural improvements at various non-provided schools throughout the county in accordance with recommendations made by the B.E.

VOL. CXXIX.—No. 4,314

OCTOBER 9, 1925.

TOWN PLANNING

THE recent publication of the Preliminary Survey for the East Kent Regional-Planning scheme, followed last week by the seventh annual country meeting of the Town-Planning Institute at Canterbury, has aroused public interest to an extent which is quite unprecedented in England, which is of good augury for the adoption of a new scheme and better way for industrial development, not only in the fair county of Kent, but also in the greater question of the rectification of past mistakes and the orderly development of new industrial areas.

The problem is one which in a greater or less degree must affect every man, woman and child living in these islands; it is no new thing, but in the bad Victorian days when industrialism triumphed over all the finer qualities, instincts and inspirations of the race, it was believed that industry and beauty were conflicting interests between which no possible union could be imagined.

Therefore, as was inevitable in this race for material rewards, other considerations were ignored and the countryside was defaced by ignoble and squalid mining towns and villages, thickened and polluted by smoke, gases and foul waste products, which turned whole districts into a semblance of Hell rather than Paradise.

Concurrently with this industrial race occurred what one may call its psychological by-products: the decay of tradition in the building crafts and other industries, the industrial robbery of the workman, the growth of class hatred and a spirit of revolt, which (as we are now beginning to perceive) had its roots in bad housing conditions and the abolition of natural beauty. It is difficult to estimate the extent of this evil, but the connection between mean streets and badly-lighted rooms and debased and mean lives is sufficiently marked to merit attention.

The natural result of an impartial consideration of such a heritage, from what might with some truth be entitled "the Dark Age of Materialism," is a desire for some remedy, some method in our madness, some better way of providing for the needs of the mass of our citizens.

"Town Planning" is the modest term which, in effect, signifies the substitution of order in place of muddle, by the application of forethought and technical skill to the solution of the extraordinarily varied problems presented by modern civilisation. It is not merely a question of providing a certain number of reasonably decent dwellings and convenient facilities for traffic, but rather a laborious and detailed investigation of natural conditions, such as subsoil, sites, rainfall, contours, birth statistics; the daily or seasonal movements of populations; the natural or special requirements of various trades and industries, followed by a deduction from the facts thus obtained.

With such information the modern town planner prepares his scheme for future development and so directs the natural exceptional growth of the city, town or village to the advantage of all its inhabitants.

In the same manner the skilled technician who is called upon to prepare a Regional Plan first ascertains all the factors which may influence the future development of a series of towns or villages comprised in a district which, for some

economic or other reason, are interrelated and whose interests and needs are similar and usually urgent.

Such problems, as in the case of the district round Manchester, are often still further complicated by the mistakes of the past, and the best that can be done is to save what remains, fight against blind opposition for the gradual improvement in existing conditions, and stimulate public opinion so that, in time, these will no longer be tolerated.

The exceptional interest of the problem presented by the industrial future now anticipated for south-eastern Kent lies in the fact that the Regional Plan starts, as it were, on a "clean slate," unhampered by any of the haphazard and muddled development inherited by less fortunate districts.

But here, as elsewhere, no matter how excellent the scheme or how well-considered the plan, the realisation of it depends on public opinion. The danger is that although the Regional scheme as a whole may be carried, so to speak, "by acclamation," yet that during the long period—say, twenty or thirty years—which may elapse before its completion, this original enthusiasm may wane, and many, if not all, the most valuable provisions for preserving natural beauty and the amenities of the district may be sapped by the forces of commercialism and speculation. Take, for example, the question of open spaces, and the limitation to excessive growth of a built-upon area by the provision of a wide belt to be reserved for agricultural land, two of the most important features in modern town planning. Does anyone imagine that when the value of land in any new town or village rises to a certain figure it will be possible to preserve either of these amenities unless public opinion is sufficiently well informed and convinced of their value to prevent any interference with the original town or regional plan? Failing this it may well be that the last state of the town or district will be worse than had no scheme been prepared.

For this reason the public interest aroused by the East Kent draft scheme, due in no small measure to the statesmanship and prescience of the late Lord Milner, and the untiring efforts of such members of the East Kent Advisory Committee as His Grace the Archbishop of Canterbury, the Dean, and the Chairman of the Committee, marks a definite advance on the right road, and should encourage those who believe in the practical value of town planning in this and other districts to join together in the necessary work of overcoming local prejudice, opposition, or doubt, so that the result of their labours may not be lost when the first serious difficulties impede progress.

An excellent example of the value of this public-spirited lead in town planning is afforded by the letter addressed to a local contemporary by Dr. Bell (the Dean of Canterbury), on the subject of the preservation of a site which is of some importance in the improvement of the "built up area" of the city of Canterbury, where, by a brief but lucid exposition of the facts, dangers and possible remedies, the Dean will, no doubt, play the part of the watchman on the tower and warn the citizens of dangers which too often pass unheeded until the time for action has passed away. May we have many who will follow this example and lead the way to the finer and better England which may otherwise remain the dream of enthusiasts, stifled by the forces of inaction and inertia.

NOTES.

The Object of Architectural Propaganda. A CORRESPONDENT, whose apparently well-meaning letter we give on another page, is not very happy in the suggestion he makes

that there is a widespread feeling amongst "amateurs" of architecture that the object of the propagandists of architecture is not to help the art, but to help the practice of architects—"that is, the real object is not to benefit the country, but to benefit the profession," though there may be some implied reservation in his somewhat hesitating reference to amateurs. In noting the ungenerous nature of the suggestion, we can assure our correspondent that whatever the belief of "amateurs" of architecture, the paramount desire on the part of all architects worthy of the name is to improve the architecture of the country; while the desire to improve "the status of the members of an institute," though a very worthy one, is subordinate to the widespread and genuine desire to improve the art. There can be little doubt that public taste in architectural matters is improving, and if so, this is ample justification for the propagandist efforts of architects and others on behalf of the art.

Another American Scholarship

WE learn that a proposal has been made to certain persons eminent in the architectural and building world, with a view to the establishment of a trust fund similar to

the American Travelling Studentship of the R.I.B.A., founded a short time ago. The time is not ripe to give details of this proposal, but the suggestions have already been warmly welcomed. Details of any scheme need carefully thinking out, for the plan to enable young English architects to study commercial architecture in America has resulted in the first student deciding to remain on the other side of the Atlantic and not come back again!

Industrial Art.

It has been pointed out by certain writers to the Press during the last week that the inferiority of design in British manufactures to-day is very marked, and the show of work in the British pavilion at the Paris Exhibition has been cited as an illustration of this. This endless controversy as to the responsibility and cause of failure to give better artistic quality to our manufactures is thus brought to the fore again. And, again, one must ask whether the public gets a fair chance? We all know that between the manufacturers and the public there come those who have to conduct the sale of the goods. If the salesman presents to the public something inferior in design and there is nothing better to choose from, then it does not follow that the public buys what it can get just because it likes it. We must allow the public some credit for better taste, unless we find that with both good and bad before them they chose the inferior. It is not exhibitions which necessarily indicate truly the capacity

that there is in the country for good design; the architectural room at the Royal Academy, and the numerous exhibitions of pictures, fail to represent a great deal of admirable work which constantly being done. Candidly, we feel that there is still much difficulty in getting a fair exploitation of our artistic talent in the productions of our industries.

THE Kent Rural Commu-

The Village Council, under whose auspices a Blacksmiths' Conference was convened

March with very encouraging practical results, has now completed its inquiry into other rural crafts. The inquiry has shown that the smith is not the village craftsman whose position is precarious. The village wheelwright, particularly, has also been affected by decline in horse traffic in country districts. With a view to considering whether practical steps can be taken to improve the outlook for this skilled and versatile craftsman—whose disappearance would be a source of no small inconvenience to the farmer—the Kent Rural Community Council is convening a further Conference in Maidstone this Saturday, and as satisfactory results of the Blacksmith Conference were largely due to public interest which it aroused, which found expression in a demand for smiths' work, it is to be expected that similar interest will be taken in the Wheelwrights' Conference. The members of the Conference will include representatives

- A FLOATING STAND for a NAVAL REVIEW -

Galashiels War Memorial.
ROBERT LORIMER, A.R.A., Architect.
T. J. CLAPPERTON, A.R.B.S., Sculptor.

of the Ministry of Agriculture, the County Council, the National Farmers' Union, the National Employers' Association of Vehicle Builders, the National Council of Social Service, the Industries Bureau, representative architects and builders, and many village craftsmen. The Conference will be held in the Sessions House, Maidstone, at 10 a.m., and we wish it every success.

THE havoc now being wrought on the country-side in order to facilitate motor traffic, or the superfluous requirements of motor traffic, can we think, be justified by those who put their claims as paramount. We would, however, of an instance—and it could be multiplied—in which a group of old trees, at the end of a lovely village, were cut down to make the locality much disfigured, in order to promote the safety of the motorist. The trees stood at the junction of two roads where they converged to unite them, and the motorist on one road was therefore enabled to see across to the other, with the result that accidents were more numerous than before, and the increased speed at which he travelled! This haste to meet the demands of motor interests is leading to grave detriment and to a loss of beauty in the country-side we can ill afford to lose, a little more consideration

should be shown for this side of the matter and more intelligent direction and restraint shown in regard to changes which have led only to an increase of the evil they were intended to prevent.

A CORRESPONDENT says he has been asked if the stone figures peeping up at odd places over the sculptured frieze of Messrs. Liberty's new building in Regent-street are a joke, and if they are intended to remain. They present a striking target, and a sportsmanlike errand boy might have a shot at them. We fear this is a case in which the symbolism of sculpture is likely to miscarry.

Tradition and Vagary.

THERE is so much lack of boundaries to-day, that thought and action tend to wander unguided by those wholesome restraints which, whatever we call them—tradition, precedent, custom—yet have their value in deciding for us the limits within which our work should be done. This is not to say that originality and personal approach is undesirable, but rather that these things enable them to function properly. But if we become too much governed by the hour and the fancied needs it sets up, which, at this time, are directed to display and the advancement of commercial publicity, we may suffer from an invasion into the more disciplined and becoming limitations of art, in our haste for commercial success. And we feel this so much in this case of the new "Liberty" building in Regent-street,

when looking at the frieze which stretches across the arc of the building. The three stone figures leaning over the parapet, as though they were looking to see if there was any room for them in the frieze, or had wandered out of it, will appear absurd enough to most people. But the lack of taste which promoted it, the sacrifice of the legitimate objects of decoration for a "publicity" appeal, so contradicts the spirit out of which anything that is beautiful can come, that we hope this curious innovation will be cut away.

IN the "personal" column of *The Times* there appeared recently a notice to say that glass painters are required for America, to paint in the mediæval manner. Does not this advertisement rather illustrate the fact that the advertisers are a good way behind us in their apprehensions of the needs of art which is also exemplified in the design of the new Cathedral for New York? It would seem they are thinking less in terms of what we need to-day than of what we have left behind, and belonged to about 50 years ago. While we are seeking the artist again, and looking for the creative impulse in art, they would appear to aim at consolidating the outworn and the derivative, mistaking semblance for reality. The conventional imitation of the mediæval manner is not one to stimulate the life of the Church to-day, which needs the grasp of life and first-hand experience, if it is to be a living witness to religion.

Galashiels War Memorial.
SIR ROBERT LORIMER, A.R.A., Architect. MR. T. J. CLAPPERTON, A.R.B.S., Sculptor.

GENERAL NEWS

Professional Announcement.

Mr. Robert Cromie, F.R.I.B.A., is now practising at 73, Edgware-road, Marble Arch, W. 2. Trade catalogues are invited.

Appointment.

The School of Architecture at University College, Dublin, under Professor Butler, F.R.I.B.A., is enlarging its activities during the coming session. Mr. Frank Scarlett, B.A., late of London University School of Architecture, has been appointed assistant to the Professor.

Partnership.

Messrs. Edmund Wimperis & Simpson, F.F.R.I.B.A., of 61, South Molton-street, W.1, and Mr. L. Rome Guthrie, F.R.I.B.A., of 37, Bruton-street, W.1, have entered into partnership, and will practise under the name of Wimperis, Simpson & Guthrie, at 61, South Molton-street, W.1.

Change of Address.

Mr. Alfred J. Taylor, F.R.I.B.A., has changed his address to 4 & 5, Bridge-street, Bath.

Mr. L. Jacob, quantity surveyor, has removed his offices to 58, Gordon-square, W.C.1.

Mr. W. A. Aickman, F.R.I.B.A., has removed to 58, Gordon-square, W.C.1. Telephone No.: Museum 6550.

Mr. T. Lawrence Dale, F.R.I.B.A., has changed his London address to 22, Craven-street, Strand, W.C. Telephone, Regent 7178.

Birch Hall, Manchester.

Birch Hall, built in the fifteenth century and headquarters of the Parliamentarians in the Civil War, is soon to be demolished and a new Grammar School erected on the site.

Dawnay Scholarships.

The three R.I.B.A. Archibald Dawnay Scholarships for Construction, competed for each year by students in the various architectural schools in Great Britain, have this year all been won by students at the Architectural Association.

Abolition of German Import Licences.

The Board of Trade announce that, as from October 1, the requirement of import licences is withdrawn for all commercial goods imported into Germany except those of which a list is published in the *Board of Trade Journal*.

Warwick Priory.

The portion of Warwick Priory still standing, which includes the Saxon wing, the sixteenth-century part, and the Georgian wing, has been sold to an American and will be taken down and transported to the United States.

Stone Age Relic.

A drinking cup, resembling a small modern bowl, of solid stone about 3 in. high and 4 in. in diameter, was recently discovered at Barnhill. The fact that the vessel is without a handle points to its being a relic of the early Stone Age and of more than ordinary interest.

Proposed Hospital for Stoke.

A big half-a-million hospital scheme for Poor Law purposes, providing for the erection of an infirmary of 400 beds and capable of expansion to 800 beds, together with its own nurses' home, &c., was approved by the Stoke-on-Trent Guardians recently.

Moslem Mosque near Wimbledon.

Excavations for the building of their first London Mosque were begun at Southfields recently by the Ahmadiyya Moslems. The new structure, which will be white, and of an Arabian style of architecture, will be surmounted with a dome rising about 50 ft. high.

Downing College, Cambridge.

Downing College has acquired a site for a library, of which Sir Giles Gilbert Scott, R.A., has prepared provisional sketch plans. A bene-

faction of £100,000 provides one wing, but £500,000 is required for the whole building and its endowment.

New School at Truro.

Lord Eustace Percy, President of the Board of Education, during a recent visit to Truro, laid the foundation stone of the new county secondary school for girls, which is being built at a cost of £21,000 to the plans of Mr. F. G. Drewitt.

Hotel, New York.

Plans for the erection of the world's tallest hotel on Fifth-avenue, between fifty-seventh and fifty-eighth-streets, are reported to be nearing completion; this fifty-six story hotel, costing £5,000,000, will reach to the height of 610 ft., culminating in a brick tower decorated with limestone in the Italian renaissance style.

Sunderland.

The River Wear Commissioners and the Sunderland Town Council have formed a joint committee to draw up a scheme for a new river quay at Sunderland, and several business organisations in the town are contemplating the erection of warehouses and stores for general merchandise in connection with the proposal.

New Bridge Over the Ouse.

A contract has been awarded by the County Council of the West Riding of Yorkshire to the Cleveland Bridge and Engineering Co., Ltd., of Darlington, for the construction of a new bridge over the River Ouse at Boothferry, near Goole. The scheme, estimated to cost £112,500, will take two years to complete, and will be carried out to the designs of Mr. Basil Mott, of Westminster.

Manchester Town Planning.

The Town Planning Committee of the Manchester City Council recently decided to ask the City Council for authority to prepare "a comprehensive civic survey of existing and prospective conditions in the city area arising out of existing and prospective land and building uses, in order that data may be available to assist the various committees in carrying out their functions."

Lunch Time Rambles in Old London.

We have received a further series of "Lunch Time Rambles in Old London," which include Temple Bar to St. Mary le Strand, by C. L. Kingsford; "The Purlieu of Soho," by W. G. Morris, telling of the romantic associations of this interesting quarter; and "The Heart of the City," by H. M. Buckingham, a ramble through the streets and alleys in the immediate neighbourhood of the Bank of England. Each number is illustrated and contains a street plan of the district described. The price is 6d. each.

New Road Material.

Successful experiments in North Wales promise to revolutionise roadmaking throughout Great Britain. Slate dust mixed with gluten formed into mortar is spread over the roadways, and granite macadam heavily rolled in; this gives a road-surface of remarkable resilience like hard rubber. The Blaenau Festiniog Council have begun road contracts at 7d. per square yard for this type of road.

A.A. General Meetings.

The following lectures have been arranged to be given at the Architectural Association, 34, Bedford-square, W.1, on Mondays, at 7 p.m.:—October 26, Mr. H. S. Goodhart-Rendel, F.R.I.B.A. (President), "Ourselves"; November 23, Mr. Manning Robertson, A.R.I.B.A., "A.A. Excursion, 1925"; January 11, Mr. H. M. Robertson, F.R.I.B.A., "The Paris Exhibition, 1925"; January 25, Mr. Anthony Bertram, "How to Look at Pictures"; February 22, Mr. H. M. Fletcher, F.R.I.B.A., "The Architecture of Cambridge"; March 22, Capt. R. L. Reiss, Director of Welwyn Garden City, Ltd., "The Architect from the Client's Point of View"; April 26, Mr. W. R. Davidge, F.R.I.B.A., "London Development"; May 31, Prof. C. H. Reilly, F.R.I.B.A., subject to be chosen.

COMPETITION NEWS

Manchester Town Hall Extension Scheme.

Manchester Town Hall Extension Committee has decided to ask the President of the R.I.B.A. to nominate assessors for the competition for best utilisation of the extension site between Lloyd-street and Peter-street.

Competitions Open.

	Particulars published in "Builder."	
Newcastle Fire and Police Station. Premiums: £500, £300, £100. Mr. P. S. Worthington, F.R.I.B.A., Assessor.	June 12 .. No	
Town Hall, &c., Pretoria. Open to architects residing in South Africa or Registered under Architects' Act, of 1909, Transvaal. Assessor to be appointed by R.I.B.A. Premiums: £250, £150, £100.	April 24 .. De	
Argentine Institute. Premiums 10,000, 6,000, 4,000, 3,000, 2,000 gold pesos. Apply parties., 35, Old Queen-street, S.W.1	Aug 7 .. Ja	
New Buildings for Liverpool College, Mossley Hill. Sir Giles Gilbert Scott, R.A., Assessor. Premiums: £500, £300 and £200. Apply to J. H. Lintern, Secretary, Liverpool College, Sefton Park-road, Liverpool	Aug. 14 .. Ma	
Australian War Memorial, Canberra. Open to architects of Australian birth. Apply High Commissioner, Australia House, Strand, London	Jan. 2 ..	
Plan for construction of Conference Hall, for League of Nations, Geneva. International Competition, Sir John Burnet being British representative on Jury of Assessors. 100,000 Swiss francs to be divided among architects submitting best plans. Programmes will be deposited in due course with R.I.B.A., 9, Conduit-street, where intending competitors should apply. Single copies from Secretary-General, League of Nations, Geneva, on payment of 20 Swiss francs.	Oct. 2 .. Oc	
Labour-saving House, Moor Park Estate, to be built at a cost not exceeding £1,500 (including builder's profit and cost of making up garden and fencing, but excluding cost of site). Designs invited from builders, but if architects are employed builders will be responsible for their fees. Premiums: £100, £50, £25. Apply Moor Park, Ltd., Moor Park, Herts.	Oct. 2 .. Oc	
Technical School to be erected at Cookstown, Co. Tyrone, for Technical Instruction Committee. Apply Mr. R. C. Burke, Technical School, Cookstown.	Oct. 2 .. Oc	
*Portstewart Golf Club	—	

* Competitions when "warned" or vetoed by the R. are Stopped.

MEETINGS

SATURDAY, October 10.

Glasgow Architectural Craftsmen's Soc. Visit to "Lion Foundry," Kirkintilloch 3 p.m.

WEDNESDAY, October 14.

Institution of Engineers-in-Charge.—dential Address by Sir G. G. Goodwin. Bride Institute, Bride-lane, E.C.4. 7.30

THURSDAY, October 15.

Northern Polytechnic.—Professor A. Richardson, F.R.I.B.A., on "Relation between Construction and Design in Architecture." At the Northern Polytechnic, Hol N.7. 7 p.m.

New Churches for South London.

A £200,000 scheme to build fourteen churches, five missions, and complete or six existing churches, to cope with the population of South London, is announced by the Bishop of Southwark. Eight sites already been acquired, and building has on four.

Suggestion for Reconstruction of Menai Bridge: Fifth-Year Work (Six-Hour Sketch).

By MR. H. THEARLE (Liverpool University School of Architecture).

CORRESPONDENCE

[While we are glad to publish letters on professional and other matters of interest to our readers, it must be understood that we do not necessarily endorse the remarks of correspondents, who will oblige us if they will express their views as briefly as possible.]

Architecture and the Local Authorities' Surveyor.

SIR,—I was very interested in your leading editorial in the issue of September 25, in which certain ideals are set forth under the headings 1, 2, 3 and 4. I am personally concerned with section 3. You are apparently unaware of the fact that in any but the most minor appointment nowadays to the position of engineer and surveyor to local authorities a careful point is made of architectural experience by Councils when interviewing candidates. I speak from post-war short-list experience.

The views in this letter must of necessity be *ex parte*, and I propose softly to accuse the architectural profession, or those of it who belong to its associations, of a somewhat illiberal lack of sympathy with members of my profession who must of necessity concern themselves greatly from time to time with questions of architectural design. Recently, on the occasion of the amalgamation of the two architectural societies, I think it would have been an altruistic gesture if membership could have been extended by invitation to those surveyors of municipal authorities who had, we will say, not less than five years' experience as architects to their Councils.

The term altruistic may need some explanation, and this is best put in the form of a query. Is the wish of the propagandists, about whom you write your editorial, that of improving the architecture in this country, or is it to improve the status of the members of an institution? I think that you will find there is a widespread feeling amongst, shall I say, amateurs of architecture that this question of propaganda is not to help architecture but to help the practice of architects—that is, the real object is not to benefit the country but to benefit the profession.

I should like to put a curious point of psychology relating to my own profession. Owing to the fact that most of us have been trained essentially as engineers, we are inclined to take a deep interest in that part of our profession which is not engineering, and from experience of my colleagues I find that in many cases this interest centres itself in architecture or its somewhat allied art of town planning.

In passing, although municipal engineers may tell you that town planning is essentially a question of engineering, I am one of a minority who consider that anyone lacking an architectural temperament and a certain amount of architectural training cannot town plan successfully. Thinking of some of the municipal men with whom I have, so to speak, grown up, I consider that the architectural work which I have seen them turn out would stand comparison by any unbiassed assessor with the work of all but the leading architects of the day, and I make bold to say that their work is considerably better on the whole than that of the average small-town architect.

I am not sanguine enough to suppose that this letter will have much effect on the views of the mandarins of the architectural profession as regards admission and consideration of those who have been for a long time a good deal concerned with local authorities' architecture, but it might be considered that after some years of the design of extensive housing schemes and the relevant site planning, baths, hospitals, above-ground conveniences, war memorials, æsthetic consideration of bridge designs, &c., the societies might admit men of an allied profession who were keenly interested in architecture and actually engaged in architectural work.

The influence which the receipt of periodical literature and attendance at meetings relating to architectural matters would have would fulfil the wish of the propagandists, at least with the class of person I am writing about. The class of architectural amateur suggested by the R.I.B.A. will not suit the case, the standard is not good enough—it must be of the same nature as the old Licentiate.

T.

Lowest Tender not Accepted.

SIR,—With reference to the correspondence in your columns, it should be remembered that there are two sides to this question. While, presumably, all the competitors in a privately invited list are able to carry out the work to the literal satisfaction of the specification, there are some contractors whose work has a character and finish not to be expressed in words, but easily more than worth such a small difference, as was mentioned by your first correspondent.

To put an extreme case: I knew of a large estate where contracts were let practically every week, and in the case of a tie, which occasionally happened, the financial official in charge would solemnly toss up, where the

technical official could have told him that of the contractors in question was decidedly better than the other.

In the case of public bodies perhaps acceptance of the lowest of a selected list is the only practicable method, but in cases it seems to be the architect's duty to point out to the owner the contractor who is likely to give him the best value for his money.

G. REA

Newsvendors' Benevolent and Provident Institution.

SIR,—I shall be obliged if you will allow me to draw attention in your columns to the dinner of the Newsvendors' Benevolent and Provident Institution, which will be held at Hotel Cecil, London, on November 5. The newsvendor works early and late that the day may be provided with their newspapers; and the purpose of this Institution is to provide those who may fall by the way, pensions for age or incapacity, or grants and other assistance to members, their widows and orphans who are in temporary difficulties. Many newsvendors have only too little opportunity for profit for illness or old age, and this Institution is to those members of the public to whom newsvendors render a daily service an opportunity to give their thanks in return.

The funds of the Newsvendors' Institution, which was established in 1839, are administered. There are at present sixty pensioners, whose welfare is constantly before the mind. Sick parents are sent to convalescent homes, orphan children are cared for in institutions, and financial help is given in cases of need. As Festival Chairman for the year, I have great pleasure in making this appeal, which, I sincerely trust, there will be a generous response. I shall be glad of offers from individuals and gentlemen willing to assist me as they can.

FREDERICK LAW

[Other letters are held over until next week.—Ed.]

A Correction.

In the note which appeared in our issue of September 18 on the Eleventh Church of Scientist, it should have been stated that Dr. Faber was consultant for the steel work for the other engineering equipment, buildings, i.e., heating, ventilation, and water supply services, Mr. F. Broadhurst was consulting engineer, Messrs. Benham being the contracting engineers for the

A Shop Front for a Perfumery: Fifth-Year Work (Six-Hour Sketch).

By MR. F. N. ASTBURY (Liverpool University School of Architecture).

THEN AND NOW

By KENNETH GLOVER, F.R.I.B.A.

is always amusing, and sometimes profitable, to look back a few years and compare conditions then and now. We are heirs of all ages, but we are occasionally inclined to find we are the refined and irreproachable product of preceding turmoils and gropings. Looking back, we shall find, not that we are forced in our belief that we are such wonderful fellows, but that, in all conscience, we have much to learn from our predecessors. In the course of some researches there came out of my dusty shelves two books, Mr. Shaw's "The English House," and Professor Kerr's "The Gentleman's House." The first published so recently as 1908, while the other came out in 1864; so that there is a space of half-a-century between the two. At first glance there does not appear much difference between these volumes. Mr. Shaw was concerned as to "The English House, How to Judge its Periods and Styles," Professor Kerr was giving the benefit of his professional experience as to "How to Plan a Residence from the Parsonage to the Palace." Apt alliteration's artful aid gives the title to the professor's title, but he disdains any literary pretensions and desired to be looked upon in no other light than as a man of business expounding, in this simple and direct manner, the knowledge acquired in the daily practice of his profession.

Mr. Sparrow's pen is the pen of a ready writer. He has a go at the architect in two chapters, entitled "Architects," and the other "Architects and Their Clients." Doubtless the chapters gave peculiar pleasure to his readers, because the layman rather enjoys the experts of all kinds getting a thrashing. He marks that we don't love doctors, lawyers, and ministers, "but we go to them when we need them." He doesn't say that we have to go to doctors when we have mysterious symptoms or severe pain because it is impossible for us to tell what is the matter or how to put ourselves right. Nor does he point out that it is impossible for the average layman to be a better than a fool if he does not take legal advice when he is "up agin the law." Of course it is done. Christian Scientists may avail themselves of medical advice, but there are extraordinary laymen who are content to conduct their own case in court. When everyone knew in 1908 that any man could design a house! Unfortunately the architects and the builders, Mr. Sparrow lumps them all together for the purpose of his attack, so that his readers are left, when they hear the piano next door, or to blame architect, builder, or both. The fire-grates, ill-fitting windows, thin floors—who is to blame? Mr. Sparrow blames these as "forced upon tenants by land-

lords." "Then," says he, "we have the greatest enemy of all—a huge window, almost as wide as the room itself, and divided into several lights." But here, again, truth will out. Who was to blame? Partly "absurd building by-laws," and partly "a belief, common among householders, that rooms could not be well lighted through openings just big enough to be in scale with the surface area of the elevations."

Mr. Sparrow is kinder to our present President of the R.I.B.A., and he quotes him with approval on the subject of windows. What do we see, looking back to 1908, which is not quite twenty years ago: a tragic, swift twenty years, which have brought wireless and cheap motor-cars and swift aeroplanes, and more Channel swimmers, and a terrible devastating war. Twenty years in these times move speedily. In 1908, was *l'art Nouveau* dead, was the last wriggling rose laid upon the bier? I forget; but doubtless it was affecting house-design, because Mr. Sparrow says: "his (a client's) one wish—and there is no harm in it—(the italics are mine)—is to have a simple good house that will not invite too much attention, like the originality of *l'art Nouveau*." It must have been a terrible time, with its attenuated roses in cast cement, in brass, wood, and bronze. Invention was the mother of attenuation. Was it, perhaps, the last wave of the precious 1890's—the backwash of Romanticism? We shall have to look up our old *Builders* and see what was going on in 1908 and thereabouts.

There can be little doubt that public taste in architectural matters has improved a very great deal during the last twenty years, and there is a more widely diffused knowledge of the true nature of architecture. This satisfactory development is, few would contest, due in no little measure to the publicity given to the work of architects by the popular journals. The motor-car has possibly helped, because it has taken so many people into the beautiful old villages of England who rarely saw them except during an annual holiday.

Unfortunately, from an æsthetic point of view, all is not gain here; too many villages have suffered the spoliation of their beauty by ugly garages and petrol signs. As Mr. Dawber pointed out at the R.I.B.A. Conference, village shopkeepers have thought to attract some of the trade of a revived village life by removing the interesting and delightful old shop windows and putting in sheets of plate glass. Alas! it is so often true that advance in one direction has to be paid for by loss in another.

But we are forgetting Mr. Sparrow and his "architects and clients." The temptation to linger over his pages is strong, but must be resisted, or Professor Kerr will continue to be forgotten on the bookshelves. One cannot

resist quoting one or two bits before we leave him:—

"It happens pretty often that the innocent-looking thing known as a plan sets a husband and wife at variance." . . . "At dinner you repeat to your wife what you remember of the architect's description, only to find that it is received in a silence filled with questions to be spoken." . . . "It is not for nothing that architects fear an English housewife." . . . "Could dear little Tommy reach the nursery window if he stood on his rocking horse?"

It is exactly sixty years since Kerr's "The Gentleman's House" was published. On the title-page is a vignette of Osborne House, and it is interesting to see plans of Balmoral and Windsor; but, of course, the real interest of the volume lies in its human side—what Professor Kerr thought about the styles, the glimpses of the mind of a cultured Victorian, the way things were thought about in 1865. The battle of the styles is in full swing, and contrasting Palladian and Mediæval plans are given. Then there is a very interesting criticism of Osborne, which was designed by Prince Albert and Mr. Cubitt, the builder. As might have been expected, it is full of defects and, significantly even in 1865, "Osborne has been, it is said, a good deal altered from time to time." Professor Kerr describes the character of the plan generally as "essentially Palladian, but of a *disembarrassed, re-embarrassed kind*," which is rather a mouthful. "The shackles of symmetry are first removed, then resumed." The Royal quarters were tacked on to a sprawling visitors' wing by a small chunk of corridor, about 12 ft. wide. This corridor is about 150 ft. long, with an exterior door at each end; drawing-room, billiard-room and dining-room are *en suite*, there being mere columns between them. Here is an insight into the home life of the Queen and the Prince. If Albert were playing billiards, then Victoria could watch him while playing her needle in the drawing-room. The building can only be described as a compromise between a palace, a house and a hotel, with the advantages of none.

This is one of Professor Kerr's aphorisms worth bearing in mind: "Some of our ardent archæologist-architects may occasionally stretch a point to carry the obsolete authenticities of the Middle Ages into practical house-building, but the effort is harmless—if the resident be pleased with his *ty*."

The Professor's summing-up of the style-battle is impartial enough: . . . "both types (classic and mediæval), therefore, are our inheritance in modern England, and to suggest the repudiation of either is to imply disloyalty to both." That is not far from the position to-day, and a historian of 1965 may well write of our time that it was the economy enforced by a great war which moulded an architectural style based upon the practical needs of a people, an architecture drawing from these two sources—mediæval and classic—the main elements of a truly national style.

289-293, Regent-street.

building is now in course of erection at south-east corner of Regent-street and Portico-street. The general horizontal lines of the Polytechnic Institute have been followed in the design, forming part of the same block. The architect is Mr. C. T. Armstrong, A.R.I.B.A.

New Municipal Offices, Yeovil.

A new block of buildings provides municipal offices, council chamber and committee room, and a new entrance to the existing building, together with a public library and a new entrance to the existing building, the latter having a separate entrance. The building will face a new street which is to be between High-street and South-street, a property which has been in the possession of the Yeovil Corporation for a number of years but which at present is so surrounded by other buildings as to be incapable of being developed. The new street will afford a site not only for the new buildings, but for a future extension, and will provide a large area of sites for new business buildings on the opposite side of the road. The new buildings are to be faced with Bath stone and a tender submitted by Messrs. Bird & Son, Ltd., of Yeovil, has been properly accepted. Messrs. Petter & Warren, A.R.I.B.A., are the architects.

Convalescent Home, Skegness, Lincolnshire.

The home is to be erected by the National Convalescent Society as a memorial to those members who were killed in the war. It is planned to accommodate both men and women, and contains in all over 100 beds. A common dining room is provided, and women's day rooms and rest rooms. A billiard room is also arranged for the patients. The building is to be of brick, with occasional stone dressings, and is to be tiled. The equipment will be such as is necessary for a first-class convalescent home. Messrs. Youngs & Son, Ltd., of Norwich, are the builders. The stonework is being done by the Empire Stone Co., and the tiles by Messrs. Ames & Fenniss. The architect is Mr. Ansell, F.R.I.B.A.

Polytechnic Gold Medal Drawings.

The drawings in the fourth annual competition for the "Bossmo" Gold Medal offered to the School of Architecture of The Polytechnic, Regent-street, are as follows:—1st, Mr. R. Moore; 2nd, Mr. J. H. Peak; 3rd, Mr. G. Stevens. The winning design is published in this issue. The Gold Medal is awarded annually by Mr. Alfred C. Bossmo, the architect, for the best architectural design for a building intended to satisfy commercial conditions. The competition this year was assessed

by Mr. Septimus Warwick, F.R.I.B.A., a past student of the School of Architecture, who made the awards as given. It is pleasing to notice the interest that past students of the School of Architecture continue to show in the work of the School.

Chinese Assembly Rooms, Kuala Lumpur.

We illustrate this week the perspective of the design placed second in the competition for new Chinese Assembly Rooms, Kuala Lumpur. Other drawings were given in our issue for May 1 of this year. The perspective is by Mr. S. J. Edwards, M.A. (Cantab.), F.R.I.B.A., P.A.S.I., of Messrs. Booty & Edwards. Mr. R. M. Love, A.R.I.B.A., of the same firm was responsible for the general design. Messrs. Booty & Edwards have been appointed architects to carry out the winning design by Mr. F. A. Mallard, A.R.I.B.A., which was illustrated in our issue for February 20, 1925.

A House near Guildford.

This house has half-timber and brick for its external walls, and a tiled roof. The accommodation provided includes, on the ground floor, dining room, living room, hall, kitchen and the usual offices, and on the first floor, four bedrooms, a servant's bedroom, bathroom, h.m.c. and good cupboard space. The architects are Messrs. Baillie Scott & Beresford.

St. Thomas' College Chapel, Ceylon.

In this chapel, which follows a Romanesque manner of architecture, emphasis is given to the nave, both externally and internally, the aisles being narrow. Projecting side chapels are a feature of the east end of the chapel. Messrs. P. T. Adams & W. Small are the architects.

Students' Drawings.

We publish this week some recent work by students of the Liverpool University School of Architecture. Further examples will appear in a later issue.

STRUCTURAL ALTERATIONS TO CHURCHES

THE Chancellor of the Consistory Court of Bristol (Judge Dowdall, K.C.), giving judgment in a suit concerning alterations to the structure of a church, has laid down the following rules, which, he said, he would generally, but not always, follow both there and elsewhere in these matters:—(1) In the case of ancient churches, no important work will be allowed unless it is approved by the Diocesan Committee or the Central Committee. (2) In the case of minor work in ancient churches and of all work in important modern churches, the designs must either be approved by the Diocesan Committee or must have been prepared by an artist or architect who has seen the church and who is of recognised standing in the kind of work proposed. (3) In the case of poor modern churches, a high standard cannot be insisted on, but the best work possible in the circumstances should be encouraged, especially in so far as this can be done without misunderstanding or offence. (4) In all cases individual character is to be encouraged, provided the work is good of its kind and neither odd, nor aggressive, nor discordant. In considering a petition before the same Court for the erection in a church of a brass tablet, of considerable size, inscribed, "In remembrance of," followed by two names and a date, Judge Dowdall said that the time had come when it was necessary to point out that the mere fact that the relatives desired to erect a tablet in a church was not in itself a sufficient reason. Some further justification should be stated and established. It was admittedly appropriate that there should be remembrance in church of those whose character or services (not necessarily conspicuous) or whose munificence were the cause of gratitude and encouragement, but, apart from genuine public service, it was now generally felt that the walls of a church were not the proper place for such records.

EXHIBITION NOTES

AUSTRALIAN PICTURES.

It is pleasant to note the increasing quality of pictures from overseas. From Canada and Australia some very good work is now often before us, and only recently we found much appreciation of the pictures by Cumbræ Stewart, an exceptionally talented artist in Australia. There is a freshness and quality of interest and expression about the pictures and drawings by Hilda Prix Nicholas, at the Beaux Arts Gallery, which one seldom sees nowadays. This lady also hails from Australia, and like Miss Stewart is very facile in the use of chalk and pastel. Two or three of her chalk figure subjects here are as vivid and sparkling as anything we have seen; vivacious life shines forth from her drawing of the "Boy Scout" (50). The larger pictures, such as the "Man" and the "Laughing Soldier" (7 & 8), have a breadth and dignity of expression which many pictures of admirable technique often miss. "Motherhood" is a very successful picture of its subject, good in form and colour and having a delightful placidity of effect. Some of the smaller pictures, such as the "Timber Mills," are very attractive; and two or three, where a perspective of distant landscape is seen through a foreground of tree branches, have a distinctly pleasing decorative quality. If we were to hazard a criticism on such excellent work it would be that the painter may suffer from the defect of her qualities; her sense of breadth and summarised results may take from her some quality of detail and technique which has, after all, a charm of its own.

EUROPE'S CIVILISATION IN STONE

THE architecture of the Renaissance—the rebirth of Classical forms and traditions in art and life—formed the subject of a lecture, the first of a series of 24, by Sir Banister Fletcher, V.P., R.I.B.A., to be given at the Central School of Arts and Crafts. To show exactly how the subject meets a direct popular demand, Sir Banister first described its nature and scope. Architecture, he said, was a material exponent of civilisation, and a record of human aspirations and achievements, while modern design was founded on ancient precedent. A knowledge especially of the Renaissance style should form part of the equipment of artists, craftsmen, antiquaries and connoisseurs, photographers, journalists, authors and teachers, since buildings are the solid and visible background of the events of the past, and often their only remaining testimony. The traveller could thus more deeply enjoy the buildings and ruins that he visited with a knowledge of their purpose.

To put the subject in its right setting, the lecturer gave first a brief review of the world-history of the structural art up to the Renaissance, from early Egyptian tombs to Mediaeval England, and thus showed how the ground was prepared for the influx of Classical ideas from the East which gave rise to the "Renaissance." Showing the connection between architecture and history, Sir Banister dealt with some of the influences on the art of the time, such as the writings of Dante, Petrarch and Boccaccio, the newly-discovered manuscripts of the Classical writers, the fall of Constantinople, the invention of gunpowder, the mariner's compass, and printing, all of which helped to awaken the new spirit of inquiry.

The remaining lectures will be given every Wednesday at 6 p.m., at the Central School of Arts and Crafts, Southampton-row, W.C.1. Particulars of the lectures are obtainable from the University Extension Registrar, S.W.7. Their general aim is to deal with the building of Western Europe from the fifteenth to the twentieth century.

THE TOWN-PLANNING INSTITUTE

THE Seventh Annual Country Meeting of the Town-Planning Institute was held at Canterbury from Friday, October 2, to Sunday, October 4. The venue was a specially appropriate one in view of the impending mining and industrial development of the East Kent region. The Mayor of Canterbury gave an official welcome to the members in the Guildhall.

PROFESSOR ABERCROMBIE (President of the Institute), who has just completed a comprehensive survey of East Kent for the Joint Town-Planning Committee (reviewed in our last issue), said that the city of Canterbury and the district of East Kent had a double interest for town planners at the moment. There was the existing beauty, and the interest which all town planners took in the vestiges of the past when preserved in such a vivid form as they found in Canterbury; and there was the added interest that the city had not been spoilt by the industrial developments of the nineteenth century, which had degraded so many of the finest cities of this country—because there was then no town planning in existence. Now there was also the extraordinary interest, the excitement, they might say, which had been caused by the development of "coal in Kent."

CANTERBURY: SOME TOWN-PLANNING PROBLEMS.

At the meeting held in the Guildhall on Friday, October 2, Mr. P. H. Warwick, M.Inst.M. and Cy.E. (the City Engineer), reading a paper on this subject, said he had been asked as the member on the spot to say a few words regarding the city which had the honour of welcoming them for this Seventh Annual Country Conference. Had the Canterbury Town-planning Scheme advanced beyond the preliminary stage, he would have been in a position to give a more detailed and descriptive paper dealing with the scheme itself. As matters stood, he could only briefly put before them an outline of some of the difficulties which his Council had already encountered, in the hope that some discussion of interest would follow.

Canterbury was the place chosen for a settlement by the primitive inhabitants long before the Romans invaded Britain, and the conquerors made it one of their chief military stations. Under the Anglo-Saxons, it became the residence of the Kings of Kent. The great event in its history was the coming of St. Augustine and the establishment of the Primacy in A.D. 597. No doubt in pre-Roman times that city was surrounded by an earthen wall and ditch, and by the discovery of Roman

bricks found embedded in the existing wall, it rather pointed that the Romans, who evidently rebuilt the gates of the city, were content with simply repairing the older walls. Until well into the last century there was probably no city in England which could show the walls in a more perfect state, and we read that in the seventeenth century there were 21 watch towers and six gateways standing. These walls, towers and gates had from time to time been repaired, for instance, Archbishop Sudbury, in 1380, rebuilt the Westgate Towers, and also repaired the walls. Unhappily, now only one gateway stood, the remainder having been demolished for improvements and, in certain cases, to obtain material for repairing roads. This Westgate was now converted into a Museum of Arms and Armour, and was annually visited by upwards of 25,000 visitors. A fine stretch of the City Wall and Watch Towers was still to be seen in the Dane John Gardens. The Castle Keep, one of the largest in England, remained, but not under the city's care.

The great glory of Canterbury, its magnificent Cathedral, could not be touched on in that paper, neither could St. Augustine's Abbey, which teemed with historical interest. It would be remembered that it was in St. Martin's Church, which contained Roman and Saxon architecture, that Augustine ministered, and for over thirteen centuries it had been continuously used for Christian worship. King Ethelbert was baptised at St. Martin's Church. He gave his palace and church in the town to Augustine, who founded on the site his cathedral, the forerunner of the present magnificent pile.

"*Ave Mater Angliae*" was the venerable title the city held, and of which it was justly proud. Dean Stanley remarked, "Canterbury can never forget that it has the glory of being the cradle of English Christianity." There was very little doubt that even from a remote period Canterbury was under municipal institutions. Before the Conquest, the city was presided over by a Chief Magistrate, or Prefect or by an officer called a Portreeve. In A.D. 1234, the city was governed by the two "King's Bailiffs." These gentlemen were superseded by a Mayor in the reign of Henry VI (1449). Edward IV in 1461, by Royal Charter, constituted Canterbury to be a county by itself, and that it should be named and called the County and City of Canterbury for ever. Perhaps these few introductory remarks, together with the plans and photographs which were exhibited, would help to

show that the city was teeming with historical associations. The beautiful buildings, and ancient structures must at all costs be preserved.

The first and chief problem was to do but still retain the city's bearing and a ties, to have powers over the built-up part of the town, to prevent modern store buildings belonging to large stores and panics from being erected next to beautiful half-timbered houses. The ordinary boundary of a scheme which excluded built-up areas certainly did not assist. It was utterly essential from a national, and even an international, view point, that a city of description should retain its amenities as full. It was anticipated that the City Council would apply for a Successive Scheme under Section 21 of the Housing Act, 1923, for protecting the area already developed especially within and near the city walls. It was hoped that if this was made the Minister of Health would grant the necessary sanction. It was interesting to note that the City of Oxford had been granted this privilege recently.

Chief of all their problems was that of Canterbury, indeed, was the heart of the East Kent. The following traffic weights through classified roads were taken in August 1925, over a period of seven days:—

Road No.	Description of Route.	No. of Vehicles.
Canterbury to—		
A28 ..	Margate ..	33,919 .. 5
A28 ..	Ashford ..	17,289 .. 2
A2 ..	London ..	12,233 .. 1
A2 ..	Dover ..	9,420 .. 1
A257 ..	Sandwich ..	4,596 .. 7
A290 ..	Whitstable ..	6,469 .. 1
B2068 ..	Newingreen(Hythe	3,413 .. 3
(1923 census)		

The shopping area now followed these through roads, and with modern traffic increasing in alarming proportions, it almost impossible to shop from a vehicle narrow ancient streets at any time of the day. The Council was considering the provision of internal by-pass roads to deal with the of the traffic to the various coastal resorts these new avoiding roads were made, the trade and shops follow their lines to a degree? If this did happen, would the fourteenth- and sixteenth-century houses which were now business premises, be void and fall into decay? Or, would the shopping centre remain and only shops necessary to meet the demands of traffic spring up on these new art? Would an internal by-pass system provide the through fast traffic, at the same time the local traffic in getting from one district to another, and by so doing ease matters the core of the town? As could be seen, great engineering difficulties would be encountered in laying down roads easy lines and gradients—demolition of property, compensation, river and railway bridges and embankment roads. The Council realised that this presented an acute financial problem bearing in mind that at present a 1d. rate levied produced only about £520.

After dealing with the road question the problem of railways appeared to rank first. To look back for a moment, it was interesting to remember that the first engine for passenger traffic was used between Canterbury and Whitstable. The Invicta locomotive built in 1852 by George Stephenson, at present now in the Council's possession, during the opening of this railway in May 1852 were worthy of attention. The engine presented to the City Council by Sir Salomons, Bart., and now stood on a platform the old City Moat Gardens. This Invicta engine was one of the chief centres of interest at the Franco-British Exhibition, and

Cottage at Nonnington.

ly at the Stockton and Darlington Rail-
centenary, and at the British Empire
ation at Wembley.

past engineers of the South-Eastern &
am and the London & Dover Railways
title or no regard for town planning when
constructed their lines and stations.
rbury struggled in the grip of the railway
as, the tentacles radiating from the
stations. The city was hemmed in by
ges and embankments, but the greatest
ar—both dangerous and exasperating—
a main line level crossing right in the
Others at St. Stephens, Broad Oak and
were all within a mile. The abolition
crossings, especially that at St. Dun-
which was in the city area, was a
urgent matter. The City Council on
l occasions had approached the Southern
ay Company, but, so far, had received
or no assistance. Naturally, the sug-
internal by-pass system of roads made
on for through traffic to avoid this level
ng. It was obvious that a central station
g all lines would mean considerable
my to the railway company, besides being
ore convenient for all rail users. A fur-
difficulty was the exclusion of extensive
a property from the Canterbury scheme.

was thought that the most desirable posi-
for a factory area lay to the north-east
city, and was on the north side of the
ro Margate (A28) hence the undulating
to the south of this road would be an
able position for industrial dwellings. It
high and open, healthy and picturesque—
well named "Scotland Hills" and "Old
". The area comprised some 664 acres,
ich 591 acres were within the city bound-
and extended from the Sturry-road across
Littlebourne-road; and from the Cavalry
cks practically to the village of Fordwich.
subsoil was of gravel with a light layer of
ble soil above. This stretch of land
far the most desirable for houses, exist-
the boundary, but, alas, it was Crown
rty and had been excluded by the
stry of Health from the scheme. The
ill's reason for including this land in the
planning area was, that in case a future
nment economised in fighting forces or
ferred the Cavalry Depot to another town,
and might then be controlled. However,
170 acres had recently been leased to
ate local company for use as a golf
which should prove a useful diversion.

development area was again further cur-
by the presence of the river and consider-
arshy land. The city was situated in a
valley, through which the river Stour
owed, but which centuries ago was nearly
l by an inlet of the sea. In past genera-
the river had been used considerably
commercial waterway. It was understood

URG AND INDUSTRIAL ENTER- PRISE IN KENT.

he afternoon session PROFESSOR ABER-
dealt at length with the probable
of the mining and industrial enterprises
and the need for careful town-planning
out the region in order to provide for the
population. He stated that the general
ion had been arrived at that about 18 to

Wingham Village.

20 pits would be adequate to deal with the whole
of the coalfield. No one would like to hazard
a definite figure as to the duration of the field,
but it was established quite definitely that it
would take several hundreds of years to get the
coal out of the soil of Kent. They had to pro-
vide for increases of population, not only for the
purpose of getting coal, but for various other
industries and occupations that would follow on
the raising of coal in that district. In the report
that had been prepared for the East Kent
Regional Committee they had made various
estimates of the populations that were likely to
come into Kent as a result of those changes. At
the present time there were about 300,000 people
living in the East Kent region, and it was
thought that the industrial population would be
nearly as much as that again. That, of course,
would not come at once; but if they estimated
30 years as the time in which the coalfield would
be fully developed they would then have to add
a considerable amount for the normal growth of
the existing towns. He thought, on a conserva-
tive estimate, that if coal continued to be the
main source of power, the population of East
Kent would be increased to between 600,000 and
700,000 in 30 or 40 years' time. With regard to
the question as to how this population was to be
settled, Professor Abercrombie said that if the
matter were left entirely to itself, without any
restrictive control, they would naturally have
a series of housing schemes attached to each pit.
He questioned whether from a sociological point
of view, apart from other considerations, it was
wise to allow those small communities to spring
up with only one single interest in life. The
proposal of the regional committee would be to
group the populations into larger communities.
There would, perhaps, be one or two towns the
size of Folkestone, three or four the size of
Canterbury, and possibly a couple the size of
Herne Bay or Deal.

The DEAN of CANTERBURY entertained the
members of the conference at tea at the Deanery.
He also presided at the evening meeting and
read a letter to the conference from the Arch-
bishop of Canterbury.

A PROGRESSIVE PROGRAMME FOR TOWNS AND COUNTRY.

At this public meeting, held in the Chapter
House, Mr. G. L. Pepler, F.S.I. (Past Pre-
sident), said that the title given to his address
was intended to emphasise the fact that town
planning represented much more than plans
put on paper by experts. It included a general
policy of development in which every inhabit-
ant had an interest. Even to those who had
made town planning their profession, it might
be an advantage, from time to time to pause
and consider the main purpose that inspired
their work. He would suggest that the main
object of town planning was to provide that all
land should be used to the best advantage, for
the benefit of the community as a whole. If
this were a correct description, its importance
was obvious, since it was on land we lived and
on land all our activities were performed.

Even ships and aeroplanes did but journey
from land to land.

It was the more amazing that in our small
island the use of our limited supply of this
essential commodity had so often been care-
lessly left to chance. One explanation was, he
thought, that in the industrial era of last cen-
tury, people were so engrossed in discovering,
harnessing and exploiting new forces that their
perspective was distorted and, also, they had
no time to spare for other things. These new
forces, also, seemed so prodigal in their possi-
bilities, and we seemed so sure of our
supremacy, that a good deal of waste could
pass unnoticed.

To-day, impoverished by a great war, and
amidst the stress of world-wide competition,
we could no longer afford the waste and con-
fusion that followed the haphazard develop-
ment of land. He invited them to consider for
a moment a few items of the waste that was
now caused by things being in their wrong
places: Land with rail or water frontage
specially suitable for industry by economising
its transport, occupied by houses; extra
lengths of power mains required because fac-
tory sites had not been reserved near the
generating stations; factories hemmed in by
houses and unable to expand; houses and fac-
tories jumbled together to their mutual detri-
ment; all kinds of travel and transport that
might be saved if the functions of business and
of workplace and home were properly related;
fertile land wasted by spasmodic outbreaks of
development and barren land carefully saved;
the consumer increasingly divided from the
producer; beautiful buildings destroyed or
hemmed in by incongruous erections. These
were only a few items; a little thought would
add many more. The trouble was we usually
didn't bother to think—we accepted.

The daily waste caused in our unplanned
towns by the consequent congestion of traffic
in the streets was graphically illustrated by an
example recently given to the British Associa-
tion by Colonel Tudsbury, of the Ministry of
Transport. He had ascertained that the
annual cost of traffic delays to one London
firm of caterers, in connection with their fleet
of 3 heavy motor vans and 18 delivery vans,
was £17,940. If one firm experienced this
loss, the total annual wastage from this cause
must be stupendous and amounted to a serious
handicap to commerce and a severe indirect
tax on the community. He had laid special
emphasis on the effect on industry and com-
merce because on that our livelihood depended.
It was, of course, equally as important that
the surroundings of our homes should be
healthy and pleasant with ample opportuni-
ties for recreation, and that our towns and
villages should have some dignity and grace.

The machinery for obtaining much of what
we desired was provided by the Town-planning
Acts. No one pretended that it was yet a per-
fect machine, but it would carry us a long way
if we equipped ourselves to make intelligent
use of it, by studying the problems of rural and

urban development so that we might have a policy to guide the machine. The Town-planning Institute was the professional body that dealt with these things. Its headquarters were in London, but annually it held a conference in the provinces and had come to Canterbury this year, partly because it was such a delightful and inspiring place, but chiefly because East Kent to-day presented perhaps the most critical problem of planning in the whole of Great Britain.

That corner of England—its front door to the Continent—had always occupied a key position. For centuries it had represented much of value in the life of the nation, and much of its history could be traced there, from Roman times and even before that. The mediæval glories of Canterbury and of the Cinque Ports had not passed away, evidence still remained of the sanctuary afforded to persecuted Protestants, their famous seaside towns were increasingly thronged with visitors from afar, and many beautiful villages still stood in that fertile and lovely countryside. All this and more they had represented in the wealth of the nation, and now their representation was to be even more complete because they were about to take a large share in its industrial life. The problem before them seemed, therefore, to be to facilitate the full development of this new asset and at the same time to preserve the rich heritage that they already enjoyed and that was so precious a part of the fabric of the nation.

Coal and iron had laid such a devastating hand on other parts of the country that at first sight the problem might appear insoluble. Happily, however, they were in a much more fortunate position. In the first place they started with a practically clean sheet and at a time when knowledge had greatly advanced. Also the leaders of those in whose capable hands the development of the greater part of the coalfield now rested had expressed themselves as anxious to co-operate with the local authorities so that the region might be developed on sound and orderly lines. They would, therefore, only have themselves to blame if they let things drift into chaos; but there must be a definite policy and a plan. Fortunately steps had already been taken to deal with the situation. On March 6, 1922, a conference, at which he had the honour to preside, was held at the Guildhall, Canterbury, and since then a Joint Town-planning Committee has been formed, representing the 17 local authorities in the region, with the object of preparing an outline plan of development. In addition, His Grace the Archbishop of Canterbury summoned a conference at Lambeth Palace, which resulted in the promotion of the East Kent Development Committee. This Committee had no statutory functions, but was formed for the purpose of focussing voluntary help. The first chairman was Lord Milner—whose loss they all so deeply deplored—who devoted to its service much of his valuable time and thought. It included also people prominent in the affairs of the region and of the Church, and leaders of the new industry, so that it was peculiarly well equipped for its task.

The course followed by the Joint Town-planning Committee was to instruct Professor Abercrombie to make a careful study of the region, to consult with the surveyors to the local authorities and with the mine owners and then present his studies and recommendations, in the form of a report illustrated by maps and diagrams, etc. This report had now been published and was the subject of Professor Abercrombie's address that afternoon. It was copiously illustrated with plans and photographs, and copies could be obtained from Mr. F. A. Cloke, 51, Strand-street, Sandwich, the honorary secretary of the Joint Committee. The report represented an exhaustive and illuminating survey of the region. Its main features, its resources, and its potentialities were all set out in such a way that the pros and cons of development could be understood and a judg-

ment could be formed. Such a store-house of information, written in so attractive a literary style, gave them an unequalled opportunity of appreciating their own possessions, and of understanding the vital problem with which they were faced.

Speaking in that place, one realised the important part that Canterbury should play in this new scheme of things, and that no doubt its citizens would take care to see fulfilled. The Corporation already had a Town-planning Scheme in hand. While geographically not the centre of the region, their history surely entitled them—if they made the necessary effort—to be its spiritual and cultural apex, and probably its shopping "West end." How could these things be added without causing the wasteful congestion to which he had already referred, or destroying the delightful

Ash Church.

characteristics of their city as it stood to-day, and that brought them visitors from far and wide? Might not a solution be found by preserving the core of their city intact, and providing round about it an adequate ring road boulevard, which would not only act as an absorber and distributor of traffic, but would also form the starting-off place for the inevitable expansion of the city, which, in its turn, should be limited by a belt of open country? One pictured the core so preserved as a place immensely attractive, free from the rush of traffic where one could move about one's business and pleasure in peace and comfort. A pleasant contrast to the chaotic centres of most of our old towns that had expanded indefinitely.

These were only suggestions based on general observations. The form of development best suited to the locality was a matter for

the people of the locality to decide, in consultation with the landowners, and representatives of business, industry, welfare, art and the like. There was no suggestion that great public works should be barked upon at once. The proposal was a programme should be laid down so that in all money spent either on public or private development should be fully effective—not wasted, as had so often been the case in the past because there had been no general scheme of things to fit into and help for. The preparation of a sound programme for development for the region and the towns and villages in it, and its realisation, were matters that a citizen could just pass on to expert or even to his own council, and feel that his personal responsibility was covered. Necessary as were expert advice and administration, they were of little avail without the driving force of public opinion. It mattered immensely to every man, woman and child that the region in which they should develop on a sane plan that would take the economical and efficient carrying of industry, and would ensure clean, healthy and pleasant surroundings for their homes and a worthy expression of corporate life. It was, therefore, the duty of all to make their aspirations known and to help forward the preparation and realisation of that plan.

Saturday's Proceedings.

On Saturday a motor tour was made of the district, visits being made to Betteshanger Colliery, Sandwich, Deal, Dover, &c. In the evening, PROFESSOR ABERCROMBIE presided at a dinner at the Colliery Hotel, Canterbury, which was attended by a large number of members of the Town-planning Institute, by the Mayor of Canterbury (Alfred Pope), the Dean of Canterbury (Dr. G. J. Bell), Mr. H. E. H. Rice (chairman, East Kent Town-Planning Committee), and representatives of many East Kent bodies.

DR. RAYMOND UNWIN, in proposing the toast of "Town Planning," said the source of his inspiration came from a tenth muse—for design, and beauty in place of scramble, confusion, and haphazardry. There had been many times in the past when Kent had borne the brunt of resisting the invader. It was now threatening the beautiful county of Kent a different kind of invasion, because it came from their own people; a more insidious and more insidious, because it was coupled with vandalism and permanent works and with much that came. It was to be resisted not with blind opposition or mere pugnacity, but with pathy and enlightenment. Those who visited the new Betteshanger Colliery that evening were impressed by the wonderful ideas that were being worked out by men who were devoting their lives to improving the amenities and increasing the safety of the region. They could not expect that these men should also be as careful not to spoil the land. It was for the men of Kent to take that care and to cherish the beauty which had been given to them.

MR. W. R. DAVIDGE, who gave the toast "Our Guests," remarked that he took his inspiration from the fact that Dr. Unwin in that his inspiration came from a tenth muse, who was, no doubt, a real being quite equal to the nine with whom he was already acquainted. He thought, however, one could not fail to be inspired by this ancient and historical city of Canterbury, with its memories of Cæsar, St. Augustine, and Thomas A'Beckett, and other famous characters in English history. With regard to the plan of the industrial development which had been the subject of their meetings and discussions, he thought the vital thing was to carry out the plan of the country with us, as they could hope to see the complete realisation of the Regional Plan unless it was backed by public opinion. He felt he was expressing the opinion of all those present in thanking their guests who were really their hosts—for the delightful way they had been received and entertained, and wished especially to express their gratitude to the Dean, who had not only allowed them

Group photograph of the Town-Planning Institute Conference, Canterbury, taken in the Cathedral precincts.

NOTE.—The right-hand side of the upper portion “reads on” to the left-hand side of the lower.

meet in the beautiful Chapter House, but, with the other members of the Advisory Committee, had done so much to arouse public interest in this important matter. In this connection he would also like to express their appreciation of the valuable work done by the late Lord Milner, the Archbishop of Canterbury, the Chairman of the Advisory Committee (Mr. Price), and the City Engineer (Mr. P. M. Warwick).

SIR R. TOWER, responding for the guests, said the inhabitants of Canterbury were as modest about their heritage as they were tenacious of their opinions; some like himself, no doubt felt some anxiety with regard to the proposals which might come from the Town-Planning Institute, but the result was, he thought, sufficiently reassuring to enable their various local societies, archaeological or otherwise, to feel they may sleep quietly in their beds. He thought they need no longer be afraid of the progress of industrialisation, as the safeguarding of the treasures which formed so unique a heritage of the county was now assured.

MR. H. V. LANCHESTER (Past President), proposed the health of "The President."

PROFESSOR ABERCROMBIE (President), in his reply, said he was glad of this opportunity of saying how greatly he appreciated the chance of doing this piece of work in East Kent with his friend Mr. Archibald. He had been greatly encouraged by the kind way in which his proposals had been received, and was impressed by the keen interest taken in the scheme, especially by the late Lord Milner, whose influence and advice was invaluable. With this interest and the energetic help of members of the Advisory Committee, he felt the future of East Kent was assured—their aim was not to destroy but to fulfil the reasonable development of the region. They had two good friends in the Dean and Mr. Rice, and with two such staunch supporters they need have no fears for the future.

DR. BELL (the Dean of Canterbury), replying to the toast of his health, said he felt it was a particularly auspicious pilgrimage which brought members of the Town-Planning Institute to Canterbury at this juncture. They much appreciated the sympathy which members had expressed, and felt assured that if the Mayor or any responsible body of their citizens approached the Town-Planning Institute on any matter of special difficulty, they would meet with a cordial and helpful assistance.

Town-Planning Progress.

The following local authorities (who are under statutory obligation to prepare town-planning schemes in respect of their areas) have reported to the Minister during the quarter ended September 30, 1925, that they have passed resolutions deciding to do so:—

Leicester, Loughborough B. London, London County Council (3rd Area). Middlesex, Hendon U.D.C. (2nd Area). Staffs, Stoke-on-Trent T.C. (3rd Area). Warwick, Coventry T.C. Yorks (N.R.), Eston U.D.C.

The following local authorities (not being authorities under statutory obligation to prepare town-planning schemes, who have voluntarily taken effective steps in the preparation of a scheme) have also reported to the Minister during the quarter ended September 30, 1925, that they have passed resolutions deciding to prepare town-planning schemes:—

Chester, Bollington U.D.C., Disley R.D.C., Hoylake and West Kirby U.D.C. (2nd Area), Yeardsley-cum-Whaley U.D.C. Devon, Plympton St. Mary R.D.C. (2nd Area). Essex, Chingford U.D.C. Lancs, Norden U.D.C., Thornton U.D.C. (2nd Area), Whitworth U.D.C. Middlesex, Staines U.D.C. Salop, Aitcham R.D.C. Somerset, Minehead U.D.C. Surrey, Carshalton U.D.C. (2nd Area), Epsom R.D.C. (Areas 4-9). WALES.—Glamorgan, Cardiff R.D.C. (3rd Area).

The following preliminary statements have been approved by the Minister of Health for the quarter ended September 30th, 1925:—Great Berkhamstead T.C., Rochford R.D.C. (Rawreth Area).

ARCHITECTS' & BUILDERS' INQUIRY BUREAU

We are glad to give questions and answers, but cannot accept responsibility for contributed replies, especially on legal matters.

May we appeal to our correspondents to submit their queries on paper of a size easily filed, and written as legibly as possible, or, better still, in typewriting!—Ed.

Sale of House: Question of Contract.

SIR,—I built a house and later a person approached me and verbally agreed to pay £800 for it. He paid £100 deposit and I gave him a receipt for that amount, worded thus:—

"Received from Mr. — of..... the sum of One Hundred Pounds (£100) deposit on account of Eight Hundred Pounds purchase price of One Detached House situate at....."

Purchase price	£800
1st deposit	£100

Balance due	£700
-------------------	------

Signed.....

The buyer entered the house on May 26, 1925, and the building was completed in accordance with my plans (which had been duly approved by the local authority) a few days afterwards. I am now requiring the balance of the purchase price (i.e., £700), but the "buyer," who is now occupying the house, refuses to pay the balance until the house is completed to his satisfaction. The additional work that he requires to be done will cost about £25, but this work was not included in the original bargain, neither was it included in the drawings (these were in my name). The "buyer" by the way, does not hold the leasehold for the land as yet; this deed is awaiting my signature. Am I compelled to carry out this additional work before I can expect payment? "YOUNG BUILDER."

[It would appear, from the form of receipt given by the vendor to the purchaser for the deposit of £100 paid by the latter, also, the conduct of the purchaser in entering into possession of the house in question, that all the essential elements of a contract are present which either party can enforce. Both are entitled to bring an action for specific performance of the contract as against the other, the action being in the nature of an equitable relief given by the Court in such cases of breach of contract. Bearing the above in mind, "Young Builder" is certainly not compelled to carry out the additional work, which, it is stated, will cost £25; but if he himself wishes to enforce the contract specifically, the only remedy open to him, he must be prepared to prove that the additional work was not included in or contemplated by the contract above referred to, and that he has in fact performed all conditions precedent which are expressed or can be implied from the terms of the contract.]

Condensation in Basement.

SIR,—The basement of a block of flats has a special Italian floor of sawdust and some mineral composition; it is very cold to the touch. When there is a drop in the temperature the air of the interior condenses and gives the appearance of damp. All the walls are discoloured. The tenant says the remedy is to take up the Italian floor and relay with wood, but that is not to be entertained. It has been suggested that asbestos should be laid on the floors and on the walls, but this, again, is an expensive job, and as this condensation trouble only occurs at intervals, when the temperature drops, we want, if possible, some cheaper remedy.

READER.

Combined Drains.

SIR,—The drains of a new building (passed by the local sanitary authorities) are connected to old ones running through an adjoining owner's property. Has the adjoining freeholder power to cut these off? Can the local authority insist on a new connection to the sewer irrespective of the fact that the old combined connection has been proved sound and, in fact, passed?

"S.F.T. CROYDON."

Quantities.

[REPLY TO C. H., SEPTEMBER 18.]

If the contractor fails to agree with the of works or the accredited person representing the Rural District Council on the quantities of materials, works, or costs, and the final agreement as agreed by the quantity surveyors, matters will be settled by the Rural District Council's surveyor or engineer, whose decision will be final.

G. W.

Water in Basement.

[REPLY TO "BUILDER'S ASSISTANT," SEPTEMBER 18.]

SIR,—A method of dealing with this trouble is as follows:—On the "bottom" which receives the flow, lay sheets of corrugated lapping them in the usual way, but with a gap of about two inches left between the ends. Cover these sheets with further sheets, time covering the space at the ends. These should be laid to fall towards a sump hole, which should if possible be outside the basement. Rising water will thus be carried along the corrugations to the sump hole, which can be pumped down by means of a pump. Concrete slabs now be laid over the corrugated sheets, when set, can be covered with a bitumen or rendering. Whatever impervious material is used it should be carried up the walls a foot or so higher than the water is likely to rise at the angle at the junction of the wall and floor should be covered. I have recently got over a very difficult job in this manner with a rendering of waterproofed cement. If further trouble is experienced I shall be glad to provide a sketch showing the method described.

ARTHUR WILSON

Preservation of Bath Stone.

[REPLY TO "VOX," SEPTEMBER 18.]

The Bath stone should be thoroughly "dragged" and all decayed stone removed should then be treated with two coats of "Fluate." This will leave the stone with a perfectly hard surface. The treatment can be applied at any time, but preferably when the stone is perfectly dry.

"MASON"

Paving Materials.

SIR,—In connection with the construction of pavements for a residential road it is suggested, for economic reasons, that the usual flagstone paving and granite curb and channel should be substituted by tarmac paving with reinforced concrete kerbs and channels. I should be obliged if any of your readers could give authoritative answers to the following questions:—

1. What would be the finished cost per run of constructing on a clay soil an 8 ft. pavement consisting of 2 in. flag stones 6 ft. of width set in cement and sand, hogging 6 in. thick for the remaining 2 ft.
2. What would be the finished cost per run of constructing on a clay soil an 8 ft. pavement consisting of clinker ash 3 in. after rolling and tarmac 3 in. thick after rolling.
3. What would be the finished cost per run of constructing on clay soil a granite curb 12 in. by 6 in. with granite channel 6 in. by 6 in.
4. What would be the finished cost per run of constructing on clay soil a pavement of reinforced concrete curb and channel of dimensions as to constitute a satisfactory substitute for the granite curb and channel mentioned in question 3?
5. Are concrete curbs and channels essential to any extent, and are they satisfactory for residential roads of 18 ft. carriageway with a longitudinal fall of 1 in 80?

"BET"

Fungus on Timber Floor.

SIR,—Would one of your readers favour with a good recipe for stopping the growth of fungus on a timber floor? The floor in question is a ground floor, laid solid on concrete with a pitch and tar layer.

IRONWORK AND ARCHITECTURE

By HECTOR CORFIATO, S.A.D.G.

ered in ancient times, the art of iron-
nserved throughout the mediæval ages
ation, and this is easily explained when
e beautiful grilles of the chapels in our
e, and the splendid straps which we
ire at the doors of many a cathedral,

and which, in the past the people in their simple
admiration said were made by mysterious and
evil forces. The Renaissance followed in the
traces of the mediæval ages, and after a de-
cadent period, the art of ironwork resumed its
progress, and nowadays some specimens equal,
if not surpass, the most beautiful examples
which our ancestors have bequeathed to us.

During the last 40 years iron has taken a
most important part in the art of building, that
is to say, architecture, which is the living and
stable expression of the surroundings in which
we live, as every civilised period bears the
stamp of its age. Technique and logic guide
us, and artistic sentiment adds the necessary
personality worthy of an artist. Thus, we can-
not design in a happy way any work in iron,
unless we have the necessary knowledge of the
technique of iron.

If the general laws which rule a composition
are the same for all works, technical qualities
come into force in the means of expression, in
all materials. A bridge built in iron has not
the same aspect as one built in stone.

Without doubt, the scale determined by the
height of man is an important factor in every
composition, but for each material the propor-
tions of dimensions vary. For instance, a
column in cast iron has not the same propor-
tions as a column in stone. With metal, ex-
pression is determined by the laws of contrast,
the parts being in solids and voids, and if a
piece of wrought iron has ornaments joined by
welding, it will have a different appearance
from a piece of iron which has been beaten and
pierced.

Every architect who undertakes a design
should have the necessary technical knowledge
in order to produce something perfect and use-
ful. One has only to notice how difficult it has
been to find a proper style in iron architecture.
No tradition binds us, but as it happens often
that an architect has no great engineering
training, and engineers know often nothing
about architecture, we come across works which
lack the most rudimental architectural beauty.
As example, we may mention the noted bridge
of Hamburg. It is purely the conception of
an engineer. It is an exaggeration of the
system of girders of equal resistance. Better
examples are to be found in England and
abroad. Stone has given definite architectural
shapes. We have not yet succeeded in giving
its proper expression to iron architecture, very
probably because it is difficult to have the cour-
age of artistic initiative. Logic plays in com-
position a most important rôle, but it should
accompany the artistic emotion, without which
no production is perfect.

One has to go back to the eleventh century for
the earliest ironworks having an architectural
and æsthetic character. These are the straps
which were used to assemble the planks of the
doors of that period. In Europe before that
date, the only example of metal doors known
to have existed, is still to be found in a church
at Aix-la-Chapelle, and this is not in iron. In
the beginning the straps were without ornamen-
tation, but the ironsmiths of the twelfth and
thirteenth century noticed that if the straps
were divided into several branches, they gave
to the doors much more solidity, because the
wood was in contact with the iron on a bigger
surface, and the straps were more resistant to
the weight of the door. They started de-
veloping the straps by making them in the
shape of a crescent, as we can see on the doors
of the cathedral of Puy. Later, by welding
and twisting they created beautiful scrolls, rich
and complicated, of which we have an example
at Notre Dame de Paris. Even these beautiful
straps did not satisfy the mediæval ironsmiths.

The process of stamping and welding was
very difficult and expensive. They adopted the
process of dividing a piece of iron into different
branches, and each branch produced smaller
ones, thus covering the whole door with a rich
ornamentation which was in harmony with the

decoration of the Gothic architecture, then at
the zenith of its beauty. Later, for economy,
iron sheets were used, and with the develop-
ment of woodwork, the art of strap-making died
out.

Important ironworks were unknown in the
mediæval ages. The price of wrought iron was
so high that it was used more often for in-
teriors. Exterior iron grilles for enclosing
large open spaces were not used until the
seventeenth century; nevertheless we find ex-
terior works of small importance; for in-
stance, interlaced grilles which were used for
protecting windows of small dimensions, iron
spikes, and some small iron doors. We see
by that what a mistake architects and designers
make when for important exterior grilles they
take as models fragments of interior grilles of
too small importance to lend themselves for big
compositions. Very probably one of the oldest
grilles is to be found at the Cathedral of Puy.
It is of the beginning of the twelfth century.
The design consists of vertical bars, well
spaced, connected by welded scrolls of flat iron,
and each motif is joined to the bar by a sort
of tie, bound round while hot, and welded. It
is a beautiful work, real lace in iron, which
does not screen the architecture of the cloisters
behind. A work of similar character is to be
found at San Vicente Avila, in Spain. The
system of welding was in use until the fifteenth
century, and one of the most beautiful wrought-
iron works in existence is at the Abbey of
Ourscamp. As during the twelfth and thir-
teenth centuries the development of ironwork
did not allow but bars of small section, and
short in length, the designer adopted the kind
of decoration we have just mentioned. There
we have the technique of iron obliging the
artist to design in a certain way. The assem-
bling of rectangular panels has produced in
Italy some interesting examples.

We have the grille of the Rinuccini Chapel at
Santa Croce, in Florence. Each panel is com-
posed of six motifs which are fixed to the
frames by small rivets. At the Palace of
Sienna we have a fine example of moulded iron
beaten and pierced, and the pulpit of the
Cathedral of Avila is one of the same category
of work. The Spaniards often used the vertical
bars diagonally, and in those of rectangular
section the small side in elevation. It gives
more resistance to the grille, and from the
artistic point of view produces contrasts of light
and shade. Grilles which show the widest
dimension in elevation are contrary to logic, have
a heavy appearance, and do not look resistant;
for instance, the one at Chiostro Verde in
Florence. In Spain veritable architectural
monuments in wrought iron were executed.
Some of the finest specimens are the grilles of

Twelfth-Century Grille, Cathedral
of Puy.

Interior Grille, Cathedral of Notre
Dame, Amiens.

the Cathedral at Zamorra; the grilles of a bishop's tomb at the Cathedral of Salamanca and the grille which is to be found in the Cathedral of Toledo. Another beautiful example of interior wrought iron is the grille of the tomb of Maximilian at Innsbruck. The Renaissance having given birth to a new and rich era, art was subsequently transformed. This transformation, combined with the progress in the building art, deprived the iron craftsman of the opportunity of producing. But even if exterior ironworks had changed, those of the interior were slightly modified. Ironwork lost in heaviness but gained in elegance and richness. For the vigorously worked iron of the past, the sixteenth century substituted embossed iron particularly for iron ornaments. We must proceed as far as Tiju in order to find big schemes for grilles, etc. In 1640 in France the first important grilles surrounding big open spaces were erected.

It is easily understood that such works were useless before that date, as all the noble residences were built according to mediæval principles, and were isolated by moats in order to avoid easy approach. Only after this custom had died out were large exterior grilles and railings designed. We have just mentioned that after the mediæval age the technique of iron began to change. From the fifteenth century, in France, as in Spain, it became the fashion to imitate stone shapes with iron. The principal lines were always in wrought iron, but the ornamentation was often in iron beaten and embossed with a hammer, or even in wrought iron. By welding it was possible to execute magnificent works of iron in one piece. But this was very heavy, and later on fixed ornaments in beaten iron were used. All the qualities of the metal were employed in order to obtain artistic effects. From the seventeenth century, the procedure of beating iron in thin sheets, and shaping it with a hammer after cutting it out, became general. Thus were obtained ornaments broadly treated in their modelling and with good effects of light and shade. For the works imitating stone shapes, often the frame was composed of pilasters, effectively treated with contrasts of solid and void. Often the frames had cornices and frequently, too, were surmounted by cartouches. At Rouen, in the church of St. Ouen, we have a very beautiful example of this kind of work of a decorative ensemble, and all the stone shapes are not heavy looking. Here in England many examples are to be found, and this style of design has been kept until the present day. St. Paul's magnificent interior grilles with gilded pilasters are fine examples of work of that kind. Among other grilles executed in a classical design is one in the Cathedral of Amiens, dating from the eighteenth century. We remark the effect of horizontal decoration which breaks the monotony of the vertical lines.

(To be continued.)

Southport School of Art.

The annual exhibition of students' work of the Southport School of Art is now being held at the Atkinson Art Gallery, Southport. The architectural section forms an outstanding exhibit. This department was re-organised after the war on the appointment of Mr. H. P. Huggill, A.R.C.A., A.R.E., as Headmaster of the School of Art. In 1923, Mr. Gordon Hemm, formerly of the Liverpool University School of Architecture, was appointed to take charge of the architectural classes. The exhibition shows the fruits of two years' serious work, and the results are very promising, considering that the majority of the students are in their early pupillage days. Architectural design and history of architecture comprise the main part of the curriculum, with a special class for measured drawings during the summer months. The courses are particularly suitable for students preparing for the R.I.B.A. intermediate and final examinations. A special afternoon class has been arranged for the preparation of the testimonies of study, &c.

THE LABOUR PARTY CONFERENCE

THE proceedings at the Conference of the Labour Party at Liverpool form a marked contrast with the proceedings of the Trade Unions Congress at Scarborough. Whilst the dominating note at the Trade Unions Congress was class warfare and the overturning of the existing order of things by revolution, and M. Tomsy was loudly cheered when he spoke of the Russian method of "relieving bankers, factory owners and landowners of responsibility," the dominating note at the Labour Party Conference has been the furtherance of the objects the Party stands for by constitutional methods. Thus the President, Mr. C. T. Cramp, in his presidential address, although he spoke of class conflict, which he explained as "the clash of interests between classes produced by the development of modern capitalism," went on to say that the fundamental task of the Party was a creative one. "We are engaged in a positive effort to bring the co-operative commonwealth into being, and we appeal for the support of all classes in the work of transforming social and economic institutions by Parliamentary methods. It is quite impossible to reconcile the constructive activities of the Labour Ministers in the field of legislation and administration with the traditional doctrine of the class struggle; but it is possible to interpret the whole work of the Labour Government from the point of view I have indicated, namely, that our conflict is not with other classes, but with social and economic circumstances."

Mr. Ernest Bevin put the difference between the constitutional view and the Communist view neatly when he said, speaking of the resolution excluding the Communist Party from affiliation with the Labour Party, if he thought for a moment that the resolution was put down because the Communists took an advanced line he would be against the Executive, but the Communists could not conscientiously reconcile the Communist basis with the basis of evolutionary democracy that the Labour Party represented.

No greater contrast can be imagined than the statesmanlike tone of the speeches delivered at Liverpool, with their grave warnings against revolutionary methods, and those delivered at Scarborough, with the incitement they offered to follow the Russian lead and to plunge into revolutionary methods to attain an end which was not disclosed, but which can be imagined when the true position of Russia is considered.

The lesson to be learned from the proceedings at these two Congresses is not, however, only one to be taken to heart by the Communists but by the nation at large. The policy adumbrated by Mr. Purcell and Mr. Smales must be fought tooth and nail. On imperfect evidence they urge the nation to rush into civil strife to attain nothing but misery; but if the Labour Party by constitutional methods can and do persuade the nation that the policy they represent is desirable and will attain the results they claim, and by proof the majority become convinced, then the will of that majority must be accepted and a peaceful revolution as regards the industrial system of this country will take place. In the one case force is alone to be opposed to reason, but in the latter it is the reasoning that has to be the force, and that force cannot be withstood by anything but argument.

It is characteristic of the British nation that they can argue vital questions without engendering ill feeling, and thus even the vital changes in the industrial system which the Labour Party have at heart should be weighed and discussed in the spirit which pervaded the proceedings at Liverpool, with mutual respect on both sides. The Labour Party have a great opportunity, but they are also in a position of great difficulty, for the Trade Unions are closely connected with the Labour Party, and the proceedings at Scarborough

certainly lend support to the view expressed in Russia, and hinted at here there is a movement on foot to induce Trade Unions to forward the revolutionary methods which have been tried in Russia. Again we can quote Mr. Cramp, whose address is reported as saying: "The challenge this policy of ours do not come to us because they have found an easier path for the peoples to tread on the long weary journey to peace, security and happiness. The road upon which they would lead the international proletariat ends in shambles; the peace they would achieve by their policy of world revolution and dictatorship is a peace of utter desolation and universal ruin." This sentence places the matter in a nutshell—revolution in this country leads not to freedom but to dictatorship. All Parties should combine to retain the freedom possessed in such a marked degree in this country, and the path to reform lies along that road indicated by the vast majority in Liverpool—constitutional action. As Mr. Cramp said, the Labour Party are in a position of difficulty but they have a great opportunity. They have greater influence with the Trade Unions than any other Party, and the Trade Unions are necessary to them if their constitutional policy is to have any chance of success. It is therefore essential that they should bring into the Trade Unions the constitutional principles so clearly expressed at Liverpool—purge the Unions from the Communist taints which have affected what we believe to be but a very small minority in the Unions. Thus they will forward the policy and as a united Party be able to stand on the lines which no one can gain on. A constitutional effort to persuade the nation to accept the industrial system they stand for.

The system called capitalistic, but which is really founded on individual enterprise, has made this nation what it is and is the system prevailing in the majority of countries; it is a tried system with its merits as well as its defects understood. The Socialistic system, which is still untried, and the onus of proof lies on those who advise its adoption, but it is entitled to take every constitutional measure to convince the country that they are right. What is damaging the country at present is the accentuating the evils we are suffering from, an inheritance from the War, is the feverish unrest engendered by those who always upon times of national distress and disaster as affording them an opportunity to promulgate revolutionary doctrines, and whose end is a disordered society.

Wooden Houses for London.

Colonel Levita and the Housing Committee of the London County Council are investigating various systems of timber houses, following a report of their architect, Mr. Topham Jones, advising that London, in the development of its cottage estates, should adopt the principle that some of the houses should be constructed in wood prepared on mass production methods.

Cathedral Glass.

Messrs. Pilkington Bros., Ltd., glass manufacturers, of St. Helens and Doncaster recently sent us a very artistic brochure describing and illustrating their Cathedral Glass. The method by which this is made—by melting the molten glass into sheets on an iron table gives a far better surface, softer colour and a larger range of tints. There are three varieties of the glass: non-formal, formal and formal patterns which are less transparent and still less transparent. Besides this is a special ornamental wire glass—where this has the wire accurately embedded between the two surfaces, and is almost invisible by the pattern.

THE BUILDING TRADE.

HINTS TO BUILDERS

By J. H. BARNES, F.I.O.B.

WHEN a builder is instructed to commence work he must be careful to see that usual preliminaries are observed. If the thing is to be erected in London it may be necessary for the site to be cleared of any existing buildings before rebuilding can commence.

Certifying Old Buildings.

Where such old buildings are demolished it may be necessary, under section 13 of the London Building Act, 1894, if the street is less than 40 ft. wide, to have the old building certified by the District Surveyor, the first course being to submit plans of the building, having the distance from some prominent projection on the opposite side of the street noted on the drawing. The District Surveyor will then attend and check these plans and return one copy of the plans to the builder. For these services the fee is payable under the London Building Act, 1894, and Schedule, together with the increases fixed by the London Council under various Acts, totalling 37½ per cent., will be 17s. 9d. per building. The plans required are usually prepared by the architect, who sometimes arranges the whole matter with the District Surveyor, and instructs the builder to pay the fees. Should that be the method adopted in connection with the contract, it would be well for the builder to take a record of the frontage line of the old buildings demolished so that he may be quite certain that the new building is erected on similar lines, in instances where some misapprehension has been made and the new building has been erected in advance of the old frontage line, which has necessitated considerable alteration in the work. The builder should take particular care to see that the frontage line is approved both by the architect and local authorities before the building has proceeded very far.

Notices to District Surveyor.

Before any building work is commenced, the builder must be given to the District Surveyor drawings submitted to him for his approval. The latter is usually arranged by the architect, and all that is necessary for the builder to do is to give the formal notice that he is about to carry out the works, which he should need to describe. On completion of the work the District Surveyor is entitled to charge a fee in accordance with the Third Schedule of the London Building Act, 1894, and the increases since granted by the London City Council.

Under the 1905 Amendment Act, it is necessary to submit the plans to the L.C.C. for their consideration of the means of fire-escapes in case of fire, and after their inspection of the drawings it is usual for the L.C.C. to issue a list of requisitions defining the requirements which will be in respect of the particular building. This duty is usually arranged by the architect who supplies the number of drawings required to the L.C.C. The District Surveyor is entitled to charge for his services, as defined by the Act. In the building is completed the L.C.C. send a representative to inspect the building and if all their requisitions relating to fire in case of fire, etc., have been complied with they will in due course issue a certificate to that effect, the fee for which is 5s. In certain circumstances it may be necessary for applications to be made to the L.C.C. for various consents, but the builder or architect would usually be notified of this when preliminary applications have been made.

Cutting away Chimney Stacks.

Where there are chimney stacks (built in connection with party walls) that require to

be cut away and demolished, it is first necessary to obtain a certificate from the District Surveyor that they may be cut away. For these services the District Surveyor is empowered to charge a fee of 10s., plus the increases before mentioned. Such certificates are a great safeguard to the builder, and application for them should not be forgotten.

Notices respecting Alterations.

For alterations to old buildings, in addition to the usual notices being given to the District Surveyor, notices should be given of intention to run flues of new stoves into old flues, cut new door openings in old walls, and similar works enumerated in the London Building Act, 1894, etc., and for which the statutory fees must be paid.

Vaults under Pavement.

In the event of any vaults being required under the public way, or pavement lights being required to light the basement of the proposed building, it would be necessary to make application to the local authorities and submit drawings showing what is required. It will not be necessary to obtain permission for pavement lights or vaults if they already existed in the old building, and applications would only apply to any new lights or vaults required. The local authorities of London have the surface rights of the footway vested in them under the Metropolis Management Act. Whether they possess the fee simple of the footway may be another story.

Buildings outside London.

For buildings to be erected outside the London area the local building regulations must be complied with and the required notices served on the proper authorities. In most cases a copy of the drawings of the proposed building must be submitted, drawn to some specified scale and showing drainage, damp-proof course and other details, and probably a block plan would be required showing the frontage line and general position of site. The builder should see that sufficient drawings are submitted to suit the requirements of local authorities, both in London and elsewhere, and having satisfied himself on that head, can calmly await the leisure of the powers that be to notify the approval or otherwise of the building scheme submitted. A builder should make sure that all necessary particulars are supplied in his form of application, as it is rather annoying, after waiting some months to obtain permission to carry out building work, to have an application rejected because the detailed information required has not been supplied.

Hoardings.

Where a hoarding is required to be erected in any street in connection with building operations, a licence so to do must first be obtained from the local authorities, and the necessary fees paid. These vary in accordance with the district. The City of London publish a list of their charges for hoarding licences, but most of the authorities outside the City charge a nominal fee per month, sometimes only half-a-crown. The local authorities will not allow any portion of the street to be enclosed without permission, otherwise all sorts of people would enclose a part of the street for various reasons, and sooner or later someone might claim a right by user to a portion of the highway. The authorities usually require a certain sum of money deposited to be used to reinstate paving, etc., if required, before they will issue a licence. The amount of money required as a deposit is based upon the area of pavement enclosed, as it is possible that that portion of the foot-

way may need relaying when the building operations have been finished.

Advertisements on Hoardings.

These are usually considered to be a wonderful source of profit to the builder, but are, in fact, quite the reverse.

Rating Hoardings.

The local authorities usually levy their general rates for a hoarding upon which advertisements are affixed, and, in addition, an "advertising rate" is sometimes "made," and the Inland Revenue will most likely issue a demand for income tax. These matters should be calculated when considering the question of letting the hoarding for advertisements. The advertising contractor will usually stipulate that he is allowed to raise the hoarding to some considerable height at his own expense. Such a hoarding will be likely to block out the light from the ground floor and greatly hamper the builder in his operations and cause a lot of unnecessary expense, so that a builder will be better off without any high advertisement hoarding being allowed around his sphere of operations, notwithstanding any small payment he may receive for such user, which would soon be lost in payment of artificial light and other increased expenses because of such high hoarding. The right of affixing advertisements to a hoarding is sometimes reserved by the building owner, and if this is so the builder should see that the person who so uses the hoarding pays the charges in connection therewith.

Licence for Raking Shores.

If raking shores are required to be fixed, during the course of building operations on the public highway, a licence for such shores will be required from the local authorities, similar to the licence required for hoarding, and the necessary fee must be paid. It is sometimes possible to arrange for the raking shores to be enclosed by the general hoarding (if one is in existence), in which case no special licence would be required. Raking shores usually project further on to the footway than the local authorities will allow the hoarding to extend, and so a licence for shores may be needed. When the fee charged for a licence is likely to be a considerable sum, say, £10, the builder should consider whether or not it would be possible to substitute some other method, on the lines of more recent building practice, to secure the necessary support for the building without raking shores, and thus save the large fee necessary.

Party Wall Notice.

Under the London Building Act, 1894, it is necessary to give notice to the joint owner of party walls that some work is contemplated to be done in connection with such structure, and the situation of the building, the nature of the proposed work, together with the name of the surveyor appointed to act in the matter, should be set forth clearly. The notice may be given by the building owner to the adjoining owner by delivering it to him personally, or sending it by post in a registered letter. It will be found in the above-mentioned Act that the term "party structure" includes party walls, partition floors, and all other structures separating buildings, stories or rooms, as defined by the Act.

Building within 10 ft. of Adjoining Building.

If it is intended to build within 10 ft. of and at a lower level than an adjoining owner's building, it is necessary under the Building Act to give notice to the adjoining owner somewhat on the lines mentioned above, and the notice should give some description of the work contemplated. In both of the above matters the building owner should seek the advice of some competent person who has had experience in dealing with such work.

THE SMALL DWELLINGS ACQUISITION ACT

A CORRESPONDENT writes to us that, being a person of small means desirous of building a small bungalow, he applied to the rural district council near a populous area for a loan under the Small Dwellings Acquisition Act, and in reply received a circular which stated that a loan could only be granted to an applicant where the value of the house to be erected would not exceed £600, and that the applicant must have been a resident for at least two years.

The bungalow he proposed to erect would somewhat exceed the sum named, and as he was also a non-resident, our correspondent says he concluded the Act was not applicable to his case. Subsequently, however, having read the article on the Small Dwellings Acquisition Act which appeared in our issue of August 21 last, he renewed his application, apparently citing the extension of the Small Dwellings Act by section 22 of the Housing Act, 1923, but received a reply that the Act of 1923 was only an enabling Act, and the scheme of the council stood as stated in the circular originally sent.

We can only take the facts as stated by our correspondent, and they require some explanation, for the local authority could only make an advance under the Small Dwellings Act, where a house was to be erected under that Act as amended by the Housing Act of 1923. Therefore it would appear they had adopted that Act, at any rate to some extent; but on the facts as stated the case seems deserving of some notice.

In the circular of the Ministry of Health special attention is called to the facilities now offered by the Small Dwellings Acquisition Act as amended "so as to enable loans to be made within much wider limits to persons who desire to purchase a house for their own occupation. It is to be observed that the Small Dwellings Act itself is only permissive. "A local authority may, subject to the provisions of this Act, advance money," but the local authority, as is shown by the circular, have adopted that Act. The Legislature by section 22 of the Housing Act has extended the operation of that Act, and if the local authority act under the original Act at all, surely the enlarged provisions should be applied in the administration of the original Act. Section 22 of the Housing Act, 1923, commences "The Small Dwellings Acquisition Act shall have effect subject to the following amendments," and these words seem to indicate that the Act must be administered as amended. The Housing Act also repealed a portion of section 1 of the Small Dwellings Act, and it is quite certain that that Act cannot be administered as regards the portion which is no longer law.

The amount fixed for an advance may lie within the discretion of the local authority, but the Legislature has twice since the Small Dwellings Act was passed raised the maximum limit showing the intention of the Act, and in the case we are considering there is the other question of residence. Our correspondent states that the circular made it a condition that the applicant must have been a resident "for at least two years," but we are unable to see where this condition is imposed even in the Small Dwellings Act as unamended. The words of section 1 subsection (1) are "to a resident in any house within the area," but section 7 even relaxes this condition as to residence, enabling an advance to be made to a person "who intends to reside in a house, as if he were a resident, if he undertakes to begin his residence therein within such period, not exceeding six months from the date of the advance as the local authority may fix."

Section 22 of the Housing Act, 1923, paragraph (a) relaxes the qualification as to residence as follows: "An advance under that Act" (the Small Dwellings Act) "may be made to a person intending to construct a house, and in such case the limitation of that Act requiring that the person to whom the advance is made

must be resident in the house shall be construed as requiring that the person should be a person intending to reside in the house when constructed." We can express no opinion on the merits of this particular case on an *ex parte* statement, but the Legislature and the Government are clearly desirous to afford facilities to persons seeking to build houses, and the Small Dwellings Act as amended has proved a most useful measure, and that is why we drew attention to its provision in our article of August 21. It is of the greatest importance, therefore, that its usefulness should not be limited by the imposition of any unnecessary conditions or that it should be administered in its unamended form.

WEMBLEY HOUSING CONFERENCE

A CONFERENCE was held last week at Wembley for the purpose of giving representatives of local authorities an opportunity of inspecting the exhibit of new housing methods and building materials.

Sir Kingsley Wood, Parliamentary Secretary to the Ministry of Health, in opening the meeting, expressed his regrets that Mr. Neville Chamberlain was unable to attend, and thanked Sir Lawrence Weaver and the Advisory Committee for their help in organising the exhibition. The housing progress made recently, he continued, was very satisfactory and in his opinion the corner had been turned; in addition to providing for the normal increase of population we were making up the deficiency. In alluding to the new apprenticeship scheme, he expressed the opinion that much might be achieved, although results must necessarily be slow. But, for all this progress, no one could minimise the fact that there was still a great deal to do—the slum problem still remained, and to solve this difficulty the rate of building must be accelerated. At present the vast majority of people were too conservative; only 10 per cent. of the houses now being built were constructed under new methods, and it was to "speed things up" that the conference was called. The Ministry was endeavouring to do what it could in the matter and the House of Commons had recently voted over £25,000 to be used for research work in new types of construction. The ultimate judge of new methods in the country must be the public, and the public should have the opportunity of inspecting new methods in order to decide for itself.

Mr. Raymond Unwin, Chief Architect to the Ministry of Health, then gave a brief survey of the various systems of construction on view. As could be seen from Sir Kingsley Wood's report, the need for adopting these methods was independent of whether the houses were better than those of the usual brick construction or the next best substitute. Those present, he said, should examine the houses with a view to their fulfilling the main requirements: they must be weatherproof, temperature-proof, stable and enduring. They must provide internal surfaces strong enough to resist wear and tear, and offer the least possible harbourage for vermin. Mr. Unwin then went on to describe the various systems in detail. A class of house departing less drastically from the ordinary building materials, but depending on arrangements for economising labour, was represented by the Dennis Wild Company's house. The essential feature of this was that a light steel frame was first erected to carry the roof and the first floor; the roof was first completed and the construction of the house proceeded with under shelter. The walls of the lower part were constructed of concrete blocks, &c., and the upper of wood framing lined with breeze blocks on the inside and tiles on the outside. By this system the demand on the brick-laying craft was reduced to 25 per cent. or 30 per cent. Concrete construction afforded the largest class of new methods, and was divided into many sub-classes. There were systems—of which Messrs. John Laing's "Easiform" house was representative—in which concrete was

poured into a mould formed by shuttering; system almost eliminated skilled work. Universal Housing Company's exhibit showed an interesting variation of this method of work; this consisted of using asbestos shuttering which remained adhering to the concrete as a permanent facing, resisting the weather outside and affording a fair face for decoration internally. The sheets were fixed to a skeleton steel frame which remained embedded in the concrete as a reinforcement. Messrs. F. Boot & Sons exhibited a house erected on the pier and panel system, of which a large number had been successfully erected in this country. The Triangular Block Co. exhibited an ingenious arrangement for providing a dense exterior concrete with a more porous interior. Mr. Unwin also touched upon a method of getting aerated concrete by mixing with the cement an effervescent chemical, thus producing a material of high insulating power. The Concrete Company had arrived at the same result by using an aggregate of even size (with no larger than 10 among it) and mixing with it a cream of cement; the coated particles of aggregate came together at all their salient points, leaving a large percentage of air voids. These last methods were of special interest because they introduced a new principle in the making of concrete. Several new methods had been adopted in the Tibenham cottage, of which Messrs. Colcutt and Hamp were the architects. The frame was of genuine oak half-timber construction. Corrugated asbestos and concrete sheets were set in grooves in the centre of the wall and the panels infilled flush with the concrete outside and clinker concrete in the middle. There remained to be discovered for this method other methods a cementing material with sufficient power to adhere equally to wood and concrete. The Minister had, however, arranged that the Department of Scientific and Industrial Research for an increase on the work on building construction problems, which it was hoped might help to solve this and other building difficulties. Visitors from the Dominions and other lands were often surprised that we made so little use of the wood house to supplement our overtaxed building industry; but failed to realise that we had a comparatively abundant supply of brick and concrete material in this country, and that nearly all our building timbers had to be imported. In conclusion Mr. Unwin drew attention to the proof which this exhibition offered—that new methods of construction do not involve, and offer no excuse for, bad planning and unpleasant design. Concrete was not a cause of cramped rooms, sun aspects, or ill-proportioned elevations; if such faults occurred with the new methods of construction they were due to want of care in thought and not to want of adaptability of material.

The representatives present were then conducted round the exhibition by members of the Advisory Committee.

Steel Houses in Demand.

The Scottish Board of Health are inviting tenders for the erection of 1,000 steel houses or houses of similar type.

Mersey Tunnel Scheme.

Mr. Basil Mott, C.B., of Westminster, Mr. J. A. Brodie, Liverpool City Engineer, were at the first meeting of the Joint Mersey Tunnel Committee at Liverpool appointed engineers for the £50,000,000 Mersey tunnel scheme.

Flintshire County Council have decided to join the conference of local authorities, proposed by Holywell Rural District Council, to discuss the scheme to build a rail and road embankment five miles in length, across the Dee estuary at an estimated cost of £6,000,000. It was suggested that the debris of the Mersey tunnel excavations should be used for the embankment.

NEW BUILDINGS IN LONDON.

Battersea.—Plans are being prepared for further extensions to the Sir Walter St. John's Schools in Battersea High-street, S.W.11, by Mr. Victor Wilkins, F.R.I.B.A., 12, York Building, Adelphi, W.C.2. The cost is estimated at £12,150. These buildings are additional to those now being erected to the designs of Mr. A. H. Ryan Tenison, F.R.I.B.A., 21, St. Peter-street, S.W.1.

Bayswater.—The premises at the corner of Queen's-road and Porchester-gardens, W.2, occupied by Messrs. W. Abbott & Son, of Ludgate-hill, E.C.4, boot manufacturers, are to be modernised and new display fronts installed. Messrs. Courtney Pope & Co., Ltd., contractors, Seven Sisters-road, N.15.

Bower-street.—It is proposed to convert large premises in Bower-street, E., into a hostel for boys for the Council of Toynbee Hall, of Commercial-road, E. The work—to cost £9,000—will be supervised by Messrs. Culpin & Bowers, 27A, Bush-lane, E.C.4.

Catford.—Mr. Arthur J. Glock, M.I.Struct.E., 34, Victoria-street, S.W.1, has under construction over 120 houses on an estate in Southend-lane and Blacklands-road, Southend Village, and large numbers of additional houses are to be put in hand shortly.

Edgware-road.—Messrs. Patman & Fotheringham, Ltd., 15, Park-street, N.1, have secured the contract for a large block of flats and shops in Edgware-road, on the site of Nos. 45-49. Messrs. George A. Lansdown & Brown, architects, 9, Regent-street, W.1. Total cost, about £35,000.

Edmonton.—The Grove Court Garage, Ltd., proposes to build a garage to accommodate under shelter about 150 cars, together with a number of lock-up garages. Mr. Albert Monk, builder, Lower Edmonton, N.9.

Golders Green.—The London Cremation Co., Ltd., 52, New Cavendish-street, W.1, propose to enlarge the Golders Green Crematorium, N.W. Mr. Alfred B. Yeates, F.R.I.B.A., architect, 18, Maddox-street, W.1.

Gower-street.—London Schools of Hygiene and Tropical Medicine are to be erected on a site in Gower-street, Malet-street, and Keppel-street, W.C. Mr. P. Morley Horder, F.R.I.B.A., architect, 5, Arlington-street, S.W.1. Over £500,000 is to be spent on the site, building and equipment.

Gracechurch-street.—A large office building is to be erected on a site at the corner of Gracechurch-street and Lombard-street, E.C.3. Messrs. J. Campbell Jones, Son & Smithers, architects, 9, Dowgate-hill, Cannon-street, E.C.

Grays.—A large terminal garage and repair workshop is to be erected in Argent-street for the National Omnibus and Transport Co., Ltd., of London. Mr. Harold Cane, architect, 9, Victoria-street, S.W.1.

Greenwich.—The Dreadnought Seamen's Hospital is to be extended by the building of a nurses' home, pathological department, &c. Sir Edwin Cooper, F.R.I.B.A., architect, 4, Verulam-buildings, Gray's Inn, W.C.

Hackney.—A site in Mare-street and Ellingford-road, E., has been purchased by the Temperance Billiard Halls, Ltd., of Wandsworth-street, S.E.8, for the erection of a new billiard hall.

Hendon.—It is proposed to build a nurses' and carry out alterations to the existing nurses' home at Colindale Hospital, Colindale-avenue, N.W.9, for the Metropolitan Asylums Board. Messrs. Edwards Construction Co., Ltd., contractors, 86A, High-street, Eltham, S.E.

Holborn.—Alterations and improvements are being made to the premises in Holborn, W.C., of Messrs. A. W. Gamage, Ltd. Messrs. Holman & Goodsham, architects, 6, King's Bench-walk, Temple, E.C.4. New shop fronts are being inserted by Messrs. Harris & Sheldon, Ltd., Birmingham.

Houndsditch.—The warehouse and offices at Nos. 25-27, Houndsditch, E.C.1, and extending back to Nos. 30-34, Creechchurch-lane, are to be rebuilt by Messrs. Griggs & Son, 100, Victoria-street, S.W.1. Messrs. Lewis Solomon & Son, architects, 133, Moore-street, E.C.2.

Hounslow.—It is proposed to build a public-house known as the Sutton Hotel, in Sutton-lane, for Messrs. Fuller, Smith & Turner, brewers. Mr. Nowell Parr, architect, 42, Cranley-gardens, South Kensington, W.

Huntly-street.—Excavation for foundations on the site at the junction of Huntly-street and Pancras-street, W.C.1, is in progress in connection with the new Royal Ear Hospital to be erected there, to the designs of Messrs Edmund Wimperis & Simpson, 61, South Molton-street, W.1. Messrs. Higgs & Hill, Ltd., builders Crown Works, South Lambeth-road, S.W.

Kingsway, W.C.—A new story is to be added to the Kodak building. Sir John Burnet, R.A., architect.

Lambeth.—New shops and flats are being erected in New Cut to plans prepared by Mr. H. A. Wright, 35, Pentonville-road, N.1. Messrs. Allan & Son, builders, 80, Chapel-street, N.1.

Leicester-street.—An extension of the showrooms of Messrs. Stagg & Mantle, Ltd., is to be built in Leicester-street, W.1. Messrs. Hall, Beddall & Co., Ltd., contractors, Waterloo Bridge, S.E.1. Mr. E. H. Abbott, architect, 6, Warwick-court, Holborn, W.C.

Leyton.—A new school is to be built in Sybourn-street, E., to accommodate 300 children, at a cost of £10,000. Mr. E. J. Coxhead, builder, 45, Bulwer-road, E.11. Messrs. Newman & Jacques, architects, 61, West Ham-lane, E.15.

Maida Vale.—A large block of self-contained flats is to be erected on a site in Maida Vale, N.W., by the Central London Building Co., 24, Grove End-road, N.W.8. Steelwork by the Aston Construction Co., Ltd., Eagle Wharf-road, Hoxton, N.

Marylebone-road.—Funds are being raised for the £30,000 required to reconstruct the Western Ophthalmic Hospital, in Marylebone-road, N.W.1. Messrs. Young & Hall, architects, 17, Southampton-street, W.C.1.

Paddington.—Rebuilding and extensions are being carried out at 161 & 163, Harrow-road, W., for the Buscot and North Berks Dairy Co. Messrs. Higgs & Hill, Crown Works, South Lambeth-road, S.W., are the contractors. Steelwork by Messrs. Young & Co., 6, Queen Anne's-gate, S.W.1. Messrs. Williams & Cox, F.R.I.B.A., 34, Henrietta-street, W.C., are the architects.

Praed-street.—A large block of corner shop premises at the junction of Praed-street and London-street, W.2, has been acquired by Messrs. R. E. Jones, Ltd., caterers, of London and South Wales. Extensive alterations and new shop fronts and fittings are involved.

St. John's Wood.—It is proposed to build a large petrol service station together with a number of lock-up garages on a site in Park-road, N.W.8. The promoters are Messrs. Petrol Service Stations, Ltd., Regent House, Kingsway, W.C.2.

Shirley-street.—Mr. G. N. Kent, Lic.R.I.B.A., 521, Barking-road, E.13, is the architect for the building of a new factory in Shirley-street, E.15, for Messrs. Coombs Bros. & Sons, Ltd., 37, Rathbone-street, E.6.

Soho.—A block of offices is being erected at No. 8-10, Little Dean-street, W.1. Messrs. Townsends (Builders), Ltd., of 81, Dean-street, W.1, contractors. Constructional steelwork by Messrs. Young & Co., 6, Queen Anne's Gate, S.W.1. Metal casements by Messrs. Crittall & Co., Ltd., of Baintree. Messrs. Woodward & Son, 15, Great James-street, W.C.1, architects.

South Kensington.—It is understood that a further stage towards the completion of the new Science Museum, at South Kensington, W., will shortly be undertaken. Mr. R. J. Allison, Chief Architect to H.M. Office of Works, Storey's Gate, S.W.1.

South Kensington.—Plans have been prepared by Mr. Matthew J. Dawson, architect, 11, Newcourt, Lincoln's Inn, W.C., for three shops, with three upper floors to be used as flats.

Stepney.—Building operations have begun upon extensions of the London Jewish Hospital, which will involve approximately £30,000. Messrs. Josephs, architects, 2, Paul's Bakehouse-court, E.C.4.

Stoke Newington.—The L.C.C. propose to build a central school at Stoke Newington, to accommodate 400 scholars. Mr. G. Topham Forrest, F.R.I.B.A., architect to the L.C.C., County Hall, S.E.1.

Strand.—Messrs. Kodak, Ltd., Kingsway, W.C.2, have purchased the premises at No. 56, Strand, W.C.2., for branch showrooms. New display fronts and fittings are to be installed.

Strand.—Messrs. Bovis, Ltd., 43, Upper Berkeley-street, W.1, have started work upon the modernisation and extension of the Howard Hotel in Norfolk-street, W.C., for the Howard Hotel, Ltd. Messrs. W. & E. Hunt, F.R.I.B.A., architects, 30, Norfolk-street, W.C.2.

Surbiton.—An extensive development scheme is being carried out on the Surbiton Hill estate by Messrs. Thorogood Bros., & Sons, 55, Bond-road, Tolworth.

Sutton.—Plans for an arcade of shops, including a hall, &c., have been prepared by Mr. Harold Bailey, 32, Bedford-row, W.C., for a local firm.

Teddington.—Plans have been prepared by Mr. John Armitage, 42, Clarence-road, Teddington, for a new hospital to cost £13,000. Tenders are shortly to be asked.

Tooting.—A block of shops and showrooms is to be erected in Upper Tooting-road, S.W., for Messrs. E. Mortimer, Ltd. Messrs. Birdwood & Mitchell, architects, 80, George-street, Portman-square, W.

Tottenham.—The foundation stone has been laid of the new hall for the parish of St. Hilda, Tottenham. Professor C. H. Reilly, F.R.I.B.A., architect, Liverpool University. Messrs. H. Knight & Son, builders, 16, Bruce-grove N.17.

Trafalgar-square.—An additional block is to be erected at the National Gallery to accommodate the collection of pictures bequeathed to the nation by the late Dr. Ludwig Mond. This will occupy the site of the old St. George's Barracks between the National Gallery and the National Portrait Gallery, and will be supervised by H.M. Office of Works, Storey's Gate, S.W.1. It is intended to begin building next year.

Upper Baker-street.—A large block of shops and flats is projected in Upper Baker-street, W., opposite Baker-street Station. Messrs. Ernest Yates & Co., architects, 37, New Bond-street, W.1.

Wembley.—A new hotel, to be called the "Century Hotel," together with tennis courts and gardens, is to be erected on a site in South Forty Farm. Messrs. F. J. Fisher & Son, architects, 38, Bloomsbury-square, W.C.1, acting for Mr. Ernest Cloke.

Business Premises, Liverpool.

New premises are to be erected for Old Calabar, Ltd., at Fazakerley, Liverpool. Mr. Max Clarke, F.R.I.B.A., is the architect.

A New Type of Door Handle and Lock.

A San Francisco mechanic, W. R. Schlage, has invented a new type of door lock, the main feature of which is a button on the inside of the knob. To lock the door it is only necessary to press the button, and unlocking is performed by simply turning the knob. There are no screws in either escutcheon plate or knob, and therefore the knob cannot be tampered with. Although the Schlage Co. has been in existence for a matter of only two years, we understand that the demand for their locks has been so great that the firm were 10,000 orders behind hand, but since building a new factory occupying 2½ acres in San Francisco, they are able to turn out 20,000 locks per month. The Presto Lock Co., whose showrooms are at Sentinel House, Southampton-row, W.C.1, have secured the sole selling rights for England, Scotland, Wales and Ireland, carrying a stock of the twenty different original designs and the five types of locks. They state that in a short period they have had very satisfactory reports and comments from architects. The lock can be installed in twenty minutes, and although a strictly utilitarian fitment is of a dignified appearance.

BUILDING TRADE
FRICTION

WE understand that Mr. W. H. Nicholls, the President of the Council of the National Allied Building Trade Employers, has resigned, and the committee of the employers which carried through the recent negotiations with what remains of the operatives' federation has also resigned upon the refusal of the employers to ratify the agreement recommended for acceptance. In addition, the London building trade employers are reported to be contemplating withdrawal from the national organisation.

It will be recalled that the bricklayers, who, like the plasterers (says the *Times*), enjoy a favoured position, broke away from the operatives' federation last spring, in order to be unhampered in the pressing of their demand for payment for time lost through inclemency of weather or other circumstances not within the operatives' control. The plasterers seceded with them. The defection of these craftsmen seriously weakened the operatives' federation, which was no longer able to speak on behalf of two unions that, by themselves, could bring the building industry to a standstill. Nevertheless, the employers proceeded to negotiate with the operatives' federation a new agreement, which provided for the revival of the Joint Industrial Council. Only when it came to the ratification of the agreement by the constituent bodies was it made apparent that the employers' committee did not possess the confidence of the various employers' organisations. The employers take the view that an effective agreement cannot be made with the operatives' federation so long as the bricklayers and the plasterers dissociate themselves from it.

On the question of wet time payment there is some possibility of the bricklayers being induced to reconsider their policy, but the plasterers are as firmly resolved as ever to act alone. The Bricklayers' Union has issued a statement containing two important points. The first is that the secession of that union from the operatives' federation was due "simply and solely" to the determination to force the question of "wet time" to an issue. The second is that, "if the present crisis in the building industry is to be overcome and peace is to be maintained, the principle of payment for wet time put forward by the operatives must be adopted." The union contends that the cost of a common scheme of payment for "wet time" would not amount to more than 6d. weekly for each operative.

TRADE NEWS

Messrs. F. D. Huntington, Ltd., building contractors, announce that to meet their expanding requirements they have now moved into larger premises at Broadway Chambers, Hammersmith, W.6.

A Useful Lantern.

For builders, contractors, surveyors, engineers and others who by the nature of their business are at times compelled to work out of doors after dark, a lamp which will yield steady and brilliant illumination and that cannot be blown or put out by wind or rain is indispensable. It is claimed that the Tilley (patent) paraffin vapour lantern fully satisfies the conditions. The first claim made on behalf of the Tilley lantern is that it is thoroughly safe and gives a 300 c.p. light for six hours at a cost of one penny. Another point is its portability, and it can be put down on the bench or any other convenient place with perfect safety. One filling is sufficient for ten hours' light, so the lantern needs little attention. It is claimed that it is easy to light and that, when once lighted, wind and weather cannot extinguish it. A special point is made of the simplicity of construction of the lantern, and as it is made throughout of solid brass, there is nothing to rust, corrode or go wrong.

RATES OF WAGES IN THE BUILDING TRADE

every endeavour is made to ensure accuracy, but we cannot be responsible for error.

(For rates of wages in the Building Trade in Scotland, see page 547)

CONTRACTS, COMPETITIONS, &c.

Some contracts still open, but not included in this List, see previous issues. Those with an asterisk inserted in this number. Certain conditions beyond those given in the following information used in some cases, such as that advertisers do not bind themselves to accept the lowest or any other than a fair wages clause shall be observed; that no allowance will be made for tenders; and deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

Date given at the commencement of each paragraph is the latest date when the tender, or the names of persons willing to submit tenders, may be sent in; the name and address at the end is the person from whom particulars of quantities, forms of tender, &c., may be obtained.

BUILDING, PAINTING, ELECTRIC LIGHTING, HEATING, etc.

OCTOBER 12.—Belgium.—CEMETERIES.—Construction of cemeteries in Belgium. The Secretary, Department, Imperial War Graves Commission, 10, Whitehall, London, W.1. Deposit £10 10s.

OCTOBER 12.—Buxton.—PAINTING.—Internal painting and decorating of the large assembly hall at the Buxton Hotel, for the T.C. F. Langley, Borough Engineer, Buxton. Deposit £1.

OCTOBER 12.—Chelmsford.—ADDITIONS.—To the Chelmsford Institution, Wood-street, for the B.G. E. Foster, F.R.I.B.A., architects, Warwick, Chelmsford Hill.

OCTOBER 12.—Dublin.—IMPROVEMENTS.—At City National School, Dublin. O'Callaghan & Webb, Frederick-street.

OCTOBER 12.—Dublin.—PAINTING.—Certain painting and works incidental thereto at the undermentioned barracks:—Island Bridge Barracks, Dublin; Barracks, Cork; Renmore Barracks, Galway; Barracks, Templemore, Felix Cronin, General. Quartermaster-General, Portobello, Dublin. Deposit £1 1s.

OCTOBER 12.—East Molesey.—HOUSES.—Erection of houses at Spreighdon-road, West Molesey, for the West Molesey U.D.C. Council Offices, St. Paul, East Molesey. Deposit £1 1s.
